\* La consommation totale maximale admissible des substances du Groupe I de l'Annexe C a été réduite de 10 tonnes PAO après approbation à la 84<sup>e</sup> réunion d'un plan pour le secteur de la climatisation domestique dans le cadre de la phase II.

\*\* Recommandé à la présente réunion, de noter que l'ONUDI, au nom du gouvernement, soumettrait une demande pour les 1 739 115 \$ US restants, plus coûts d'appui d'agence à hauteur de 121 738 \$ US, lors de la réunion où le pays soumettra la phase I de son plan de mise en œuvre de l'Amendement de Kigali relatif aux HFC ou lors de la 96<sup>e</sup> réunion, à la première occurrence.

Remarque : l'Accord conclu entre le gouvernement de l'Égypte et le Comité exécutif a été révisé lors de la 84<sup>e</sup> réunion.

## DESCRIPTION DU PROJET

1. Au nom du gouvernement de l'Égypte, l'ONUDI, en sa qualité d'agence d'exécution principale, a présenté une demande de financement de la quatrième tranche de la phase II du plan de gestion de l'élimination des HCFC (PGEH), pour un montant total de 4 523 678 \$ US, comprenant 4 039 413 \$ US, plus les coûts d'appui d'agence à hauteur de 282 759 \$ US pour l'ONUDI, et 180 000 \$ US, plus les coûts d'appui d'agence à hauteur de 21 506 \$ US pour le PNUE.<sup>2</sup> La proposition comprend un rapport périodique sur la mise en œuvre de la troisième tranche, le rapport de vérification de la consommation de HCFC pour la période 2021-2023 et le plan de mise en œuvre de la tranche pour 2024-2026.

### Rapport sur la consommation de HCFC

2. Le gouvernement de l'Égypte a déclaré une consommation de 236,65 tonnes PAO de HCFC en 2023, quantité de 39 pour cent inférieure à la valeur de référence des HCFC aux fins de conformité. La consommation de HCFC pour la période 2019-2023 est indiquée au tableau 1.

\* Données du programme du pays.

\*\* Consommation moyenne entre 2007 et 2009.

3. En 2023, le HCFC-22 consommé l'a été uniquement dans l'entretien d'équipements de réfrigération et de climatisation existants ; l'augmentation de consommation d'entretien en 2023 est discutée plus en détail au paragraphe 24 ci-dessous. Avec le soutien aux conversions entreprises dans le cadre de ce projet, le pays a éliminé sa consommation de HCFC-22 dans la fabrication d'équipements de réfrigération et de climatisation et dans la fabrication de mousses de polystyrène extrudé. Le HCFC-142b, qui était utilisé comme agent d'expansion combiné au HCFC-22 dans la fabrication de mousses de polystyrène extrudé, a été éliminé de la même manière, conformément à l'interdiction datant du 1<sup>er</sup> janvier 2023 d'utiliser des HCFC dans la fabrication de mousses de polystyrène extrudé. L'importation et la fabrication d'équipements utilisant des HCFC ont été interdites le 1<sup>er</sup> janvier 2023, les importations de R-406A le 1<sup>er</sup> janvier 2023, celles de HCFC-141b le 1<sup>er</sup> janvier 2020 et celles de HCFC-141b contenu dans

<sup>2</sup> Selon la lettre du 2 février 2024 du Ministère de l'environnement de l'Égypte adressée à l'ONUDI.

les polyols prémélangés, le 1<sup>er</sup> janvier 2018. De petites quantités de HCFC-123 et de HCFC-124 sont utilisées de manière intermittente dans l'entretien des équipements de réfrigération et de climatisation.

#### *Rapport de mise en œuvre du programme du pays*

4. Le gouvernement de l'Égypte a communiqué des données sur la consommation sectorielle de HCFC dans le cadre du rapport sur la mise en œuvre du programme de pays de 2023 qui correspondent aux données déclarées en vertu de l'article 7 du Protocole de Montréal.

#### *Rapport de vérification*

5. Le rapport de vérification a confirmé que le Gouvernement met en œuvre un système d'octroi de licences et de quotas des importations et des exportations de HCFC, et que la consommation totale de HCFC déclarée au titre de l'article 7 du Protocole de Montréal de 2021 à 2022 et au titre du rapport de mise en œuvre du programme du pays de 2023 était correcte (comme indiqué dans le tableau 1 plus haut). La vérification a conclu que l'Égypte était en conformité avec la consommation maximale admissible pour 2021-2023 de toutes les substances du Groupe I de l'Annexe C, conformément à son Accord avec le Comité exécutif.

#### Rapport périodique de la mise en œuvre de la troisième tranche de la phase II du plan de gestion de l'élimination des HCFC

#### *Cadre juridique*

6. En date du 1<sup>er</sup> janvier 2023, le pays a mis en vigueur l'interdiction d'importer et de fabriquer des équipements utilisant du HCFC-22 ; d'utiliser des HCFC et des mélanges de HCFC pour la fabrication de mousses de polystyrène extrudé ; d'importer du R-406A et d'importer du HCFC-142b. Les importations de HCFC-141b ont été interdites le 1<sup>er</sup> janvier 2020 et celles de HCFC-141b contenu dans les polyols prémélangés, le 1<sup>er</sup> janvier 2018. Le gouvernement de l'Égypte a ratifié l'Amendement de Kigali le 22 août 2023. En 2022, le Gouvernement a amendé les tarifs douaniers d'importations pour exempter les frigorigènes à faible potentiel de réchauffement planétaire (PRP) (notamment le HFC-32, le R-290, le R-600a, le R-717 et le R-744) de la taxe de 5 pour cent appliquée au HCFC-22, aux HFC et aux mélanges de HFC.

#### *Activités dans le secteur de la fabrication*

#### Secteur de la fabrication des mousses de polystyrène extrudé

7. La phase II comprenait la conversion de quatre fabricants de mousses de polystyrène extrudé (CMB, Insutech, Chema-Foam et Modern Plastics) dont la consommation totale de HCFC-22 était de 559,0 tm et celle de HCFC-142b était de 24,3 tm à un mélange à 60/40 de HFO-1234ze et d'éther diméthylque. L'équipement pour les quatre fabricants a été livré et installé et les inspections de sécurité ont été entamées. Ces conversions ont été réalisées et un mémorandum d'accord a été finalisé afin de permettre le paiement des surcoûts d'exploitation, d'ici décembre 2024.

#### Secteur de la fabrication des mousses de polyuréthane

8. La phase II comprenait l'élimination du HCFC-141b par le biais de la conversion des entreprises restantes du secteur de la fabrication des mousses de polyuréthane (PU), notamment la conversion au cyclopentane de huit entreprises de fabrication de réfrigérateurs domestiques afin d'éliminer 372,5 tm de HCFC-141b ; de deux entreprises de fabrication de chauffe-eau électriques afin d'éliminer 50,0 tm de HCFC-141b au cyclopentane ; et un projet groupé afin de remplacer 114,4 tm de HCFC-141b utilisé par 38 petites et moyennes entreprises (PME) par du formate de méthyle. Ces conversions ont été réalisées à

l'exception de celle d'une entreprise, Bahgat.

9. Lors la 92<sup>e</sup> réunion, l'ONUDI a déclaré<sup>3</sup> que Bahgat s'était retiré du projet et avait quitté le secteur de la fabrication d'équipements de réfrigération domestique en raison des fluctuations du marché dues à la pandémie de COVID-19. Comme l'ONUDI avait déjà acheté et livré l'équipement pour convertir cette entreprise, conformément à la décision 79/34(e), l'ONUDI a recherché une autre entreprise qui pourrait utiliser cet équipement plutôt que d'essayer de le mettre aux enchères. Bien que l'ONUDI n'ait pas été en mesure de trouver une entreprise pour laquelle le financement n'avait pas déjà été demandé, Tredco, une entreprise éligible qui participait à la phase II du PGEH, a souhaité acquérir la ligne de production existante chez Bahgat et utiliser l'équipement fourni par l'ONUDI afin de convertir la ligne en la déplaçant dans ses propres installations. Par conséquent, l'ONUDI a proposé de fournir à Tredco l'équipement et d'utiliser le solde restant du projet de fabrication des mousses de polyuréthane (7 214 \$ US) pour le transport de l'équipement de Bahgat à Tredco, toute étude d'ingénierie nécessaire, et pour détruire/rendre inutilisable la machine de production de mousse utilisant du HCFC-141b. De façon exceptionnelle, le Comité exécutif a approuvé cette demande (décision 92/12).

10. Ultérieurement, l'ONUDI a déclaré que les deux entreprises Bahgat et Tredco n'avaient pas réussi à se mettre d'accord sur les termes de transfert de l'équipement et a demandé au Secrétariat si elle pouvait inviter un autre fabricant de mousses de polyuréthane, Siltal, à acheter la ligne de fabrication existante de Bahgat, afin que Siltal puisse, avec le soutien de l'ONUDI, convertir la ligne au cyclopentane. De façon exceptionnelle, et sachant que l'objectif de ce changement de bénéficiaire lors de la 92<sup>e</sup> et de la présente réunion restait identique, à savoir, garantir que l'équipement fourni par le Fonds multilatéral n'aurait pas besoin d'être vendu aux enchères, mais pourrait à la place être utilisé pour assister une entreprise éligible à convertir une capacité éligible de HCFC au cyclopentane, le Secrétariat a conseillé à l'ONUDI de procéder au changement de bénéficiaire, étant entendu que Siltal remplissait les mêmes conditions que Tredco lors de la 92<sup>e</sup> réunion, à savoir, (a) que Siltal devrait autrement acheter ce même type d'équipement, (b) que les spécifications de l'équipement existant soient conformes aux besoins de Siltal de façon à ce que l'entreprise puisse rapidement utiliser l'équipement une fois les travaux nécessaires de génie civil effectués, (c) que le solde restant (7 214 \$ US) ne serait pas utilisé pour les travaux de génie civil, mais que ces éventuels coûts soient pris en charge par Siltal et (d) que le solde restant soit utilisé uniquement pour le transport de l'équipement, toute étude d'ingénierie nécessaire et pour détruire/rendre inutilisable la machine existante de production de mousse utilisant du HCFC-141b.

11. Les entreprises Siltal et Bahgat ont conclu un accord pour le transfert de l'équipement. Au moment de la finalisation du présent document, l'ONUDI était en train de prendre les dispositions nécessaires avec le fournisseur de la technologie et les entreprises afin de mener à bien le transfert et l'installation.

#### Secteur de la fabrication des appareils de climatisation résidentiels

12. La phase II comprenait la conversion de cinq entreprises de fabrication de climatiseurs résidentiels (El-Araby, Fresh, Miraco, Power et Unionaire) (pour une consommation totale de 1 189,78 tm de HCFC-22) au HFC-32 et, si les entreprises le décidaient une fois la technologie disponible, au R-454B (décision 84/72(b)). Les équipements destinés à El-Araby, Fresh, Power et Unionaire ont été livrés et installés, et la mise en route a été réalisée dans toutes les entreprises sauf Power. L'équipement pour Miraco a été fourni, mais, en raison de délais d'importation de l'équipement, n'a pas encore été livré ; la livraison et l'installation devraient être terminées d'ici décembre 2024.

13. Conformément à la décision 88/70(a)(ii), l'ONUDI a fourni une version révisée du calendrier du Gouvernement pour la transition des entreprises de fabrication d'équipements de climatisation à la fabrication exclusive d'équipement à faible PRP pour le marché local. Comme proposé lors de la 88<sup>e</sup> réunion, le Gouvernement exigera que les cinq fabricants produisent exclusivement des équipements

<sup>3</sup> Paragraphes 31 à 36 du document UNEP/OzL.Pro/ExCom/92/9.

de climatisation résidentielle au HFC-32 pour le marché local d'ici le 1<sup>er</sup> janvier 2028. Cependant, en vue d'établir un calendrier plus rapide que celui indiqué au Tableau 3 du document UNEP/OzL.Pro/ExCom/88/47, le Gouvernement demanderait aux entreprises de fabriquer exclusivement des équipements de climatisation résidentielle au HFC-32 pour le marché local d'ici le 31 décembre 2026 de façon à être éligible pour recevoir les surcoûts d'exploitation. Par conséquent, l'ONUDI a signé des contrats pour le décaissement des surcoûts d'exploitation conformément au calendrier pour El-Araby et Fresh ; Unionaire a accepté d'avancer son calendrier dans son contrat de surcoûts d'exploitation (à savoir, au 1<sup>er</sup> janvier 2025). Le contrat avec Power devait être signé au troisième trimestre 2024 ; comme Unionaire, l'entreprise a accepté d'avancer son calendrier pour fabriquer exclusivement des équipements de climatisation résidentielle au HFC-32 pour le marché local d'ici le 1<sup>er</sup> janvier 2025. En raison des délais de conversion pour Miraco, un contrat de surcoûts d'exploitation pour cette entreprise n'a pas encore été développé.

14. Conformément à la décision 88/70(a)(ii), l'ONUDI a aussi soumis les résultats de ses études d'évaluation des risques et d'étude de marché concernant le secteur de la fabrication d'équipements de climatisation résidentielle ; ces rapports sont annexés au présent document. L'évaluation des risques a conclu, entre autres, que pour les scénarios considérés, la probabilité qu'une source d'inflammation soit présente en conjonction avec une fuite de frigorigène HFC-32 à concentration inflammable était de  $10^{-9}$  (« extrêmement difficile ») dans toutes les catégories de sévérité, et donc que le risque associé à l'utilisation d'équipements de climatisation utilisant du HFC-32 est considéré comme acceptable. Les principales conclusions de l'étude de pénétration sur le marché étaient entre autres que le rendement énergétique était une priorité importante pour les consommateurs ; que la disponibilité de services après-vente robustes serait importante afin de garantir la pénétration sur le marché d'équipements de climatisation résidentielle au HFC-32 ; que les consommateurs sont prêts à accepter une hausse de prix modeste de 5 pour cent des climatiseurs pour leurs spécifications respectueuses de l'environnement ; que les plateformes de médias numériques étaient recommandées comme canal de communication primaire afin de transmettre les bénéfices des climatiseurs respectueux de l'environnement et d'intéresser les consommateurs.

#### Secteur de la fabrication des appareils de climatisation commerciale

15. La phase II comprenait l'assistance technique pour la conversion de trois entreprises (EGAT, Volta et Delta Construction and Manufacturing (DCM)) qui fabriquent des équipements de climatisation centrale pour une utilisation commerciale légère et résidentielle (approximativement inférieure à 144 000 BTU/h (12 tonnes de réfrigération (TR)) à des solutions de remplacement à faible PRP et, pour des systèmes de plus grande capacité, à une combinaison de solutions de remplacement à faible PRP et de refroidissement par évaporation indirecte (IEC), résultant en une unité hybride détente directe-évaporation indirecte (IEC-H). Lors de la 88<sup>e</sup> réunion, l'ONUDI a déclaré que durant les consultations avec les parties prenantes, trois fabricants de climatiseurs commerciaux supplémentaires (Tiba Engineering Industries, Misr Engineering and Industries et Miraco-Carrier)<sup>4</sup> avaient exprimé de l'intérêt pour participer au projet ; après des consultations avec le Secrétariat, des lettres confirmant leur participation, comprenant l'engagement à s'assurer que l'équipement serait converti uniquement à des solutions de remplacement à faible PRP pour la composante à détente directe, ont été reçues.

16. L'ONUDI a soumis un rapport sur le bilan de l'assistance technique fournie aux entreprises de climatisation commerciale qui a, entre autres, conclu que les performances du système hybride détente directe-évaporation indirecte (IEC-H) dépassaient celles des systèmes à détente directe. Des tests sur les prototypes ont été entrepris dans deux zones climatiques représentatives du Caire, du delta du Nil et de la côte est en été. Une analyse économique a montré des économies nettes réalisées sur les unités hybrides

<sup>4</sup> La participation de ces entreprises supplémentaires ne coûterait rien de plus au Fonds multilatéral, et aucun financement ne serait directement octroyé aux entreprises au titre de cette activité d'assistance technique ; leur participation facilitera l'adoption de la technologie à faible PRP sur le marché, contribuant ainsi à la pérennité de l'activité.

ICE-H en raison de leur consommation électrique réduite par rapport à une unité à détente directe après avoir pris en compte les coûts initiaux plus élevés pour les unités hybrides et leurs coûts en eau plus élevés aussi. Le seuil de rentabilité pour cette unité était atteint en 3,11 ans. Le rapport est annexé au présent document.

17. Dans le cadre de sa campagne de sensibilisation aux équipements de climatisation commerciale à faible PRP et bon rendement énergétique, les unités hybrides IEC-H fabriquées par les entreprises ont été exposées lors de la 15<sup>e</sup> Conférence internationale sur les constructions durables et les avancées en nanotechnologies dans le domaine de la protection incendie, de la réfrigération et climatisation et de l'environnement de la construction qui s'est tenue au Caire les 2 et 3 mars 2024. Cette exposition comprenait aussi une unité hybride IEC-H fabriquée par une septième entreprise, Sustainable Air Technology, qui a découvert cette technologie grâce au projet. Quatre entreprises (DCM, Volta, Tiba Engineering Industries, Misr Engineering and Industries) offrent désormais des unités hybrides IEC-H dans leur catalogue de production usuelle.

*Secteur de l'entretien de l'équipement de réfrigération*

18. Les activités suivantes ont été mises en œuvre dans le cadre de la troisième tranche :

- (a) Des formations ont été dispensées à 115 agents des douanes et importateurs (dont 19 femmes) traitant des frigorigènes illégaux et frauduleux ; du programme de surveillance du marché des frigorigènes et de la mise en œuvre des interdictions au 1<sup>er</sup> janvier 2023 ; de plus, 375 techniciens (dont 150 techniciennes) ont été formés aux bonnes pratiques d'entretien des équipements de réfrigération et de climatisation ;
- (b) Une formation aux achats écologiques a été dispensée à 471 fonctionnaires et consultants (dont 87 femmes) dans le cadre de la formation sur la mise en vigueur du code de la réfrigération ; une autre formation est prévue en mai 2024 ;
- (c) De l'équipement a été fourni à huit centres de formation (unités de récupération, pompes à vide, jeux de pinces Lokring, détecteurs de fuites, manomètres à 4 voies et outils d'entretien) ; et
- (d) Des kits d'outils d'entretien et des équipements ont été livrés aux sept centres de formation.<sup>5</sup>

19. Les activités suivantes ont été retardées et sont à divers stades de mise en œuvre :

- (a) Les outils réglementaires et institutionnels afin de faire appliquer le programme de certification sont encore en cours de conception et la formation et la sensibilisation aux normes et aux codes locaux n'ont pas encore eu lieu ;
- (b) Le programme pilote de certification des techniciens a été lancé par le biais d'un contrat de certification des techniciens après-vente ; le premier lot de techniciens n'a pas encore été certifié. Les 167 kits d'outils précédemment fournis (à savoir, unité de récupération, bonbonne, pompe à vide, ensemble d'outils d'entretien) doivent toujours être distribués aux ateliers d'entretien comprenant des techniciens certifiés ;
- (c) Quatre codes nationaux sont en cours de révision, les révisions au code relatives au réseau de froid urbain sont terminées ; les révisions relatives au refroidissement durable dans les

<sup>5</sup> Comportant des unités de récupération, des jeux de pinces Lokring, des appareils pédagogiques avec différents frigorigènes, des outils d'entretien et des consommables.

nouvelles communautés urbaines sont presque terminées ;<sup>6</sup> les révisions relatives au chauffage, à la ventilation et à la climatisation ont été entamées ; et les révisions relatives à la chaîne du froid ont été entamées ;

- (d) Deux cents kits d'appareils (à savoir, des machines de récupération, des pompes à vide et manomètres, des manomètres de haute précision, des bonbonnes, des thermomètres) ont été achetés pour les centres pilotes de récupération et de régénération de frigorigènes ; ces kits d'appareils seront distribués aux ateliers afin de collecter les substances réglementées pour leur régénération au centre qui a été établi. Le centre de régénération est en attente de finalisation d'un permis de travail, celui-ci devrait être accordé d'ici le 31 mai 2024, avant la réception des frigorigènes récupérés et le début de la régénération ; l'objectif de récupération d'au moins 80 tm et de régénération d'au moins 56 tm de frigorigène devrait être atteint d'ici juin 2026 ;
- (e) Une évaluation des équipements nécessaires au réseau de services après-vente en climatisation a été réalisée et un contrat a été signé avec un expert en sécurité afin de conseiller sur les mesures de sécurité nécessaires pour les centres du réseau de services après-vente, avec la fourniture de kits d'outils d'entretien portables pour les équipes de terrain et les outils de soutien aux centres d'après-vente n'ont pas encore été finalisés ;
- (f) Le programme d'endiguement et de prévention des fuites de frigorigènes a été mis en œuvre, et se concentre sur les gros équipements de réfrigération et de climatisation ; et l'inspection et la certification pilote d'un ou deux bâtiments devraient avoir lieu d'ici décembre 2024.
- (g) La livraison d'équipement à l'institut de formation qui a été sélectionné pour accueillir le centre d'excellence en matière de frigorigènes inflammables, prévue d'ici mars 2022, a été retardée ; le matériel pédagogique a été préparé et le centre devrait être opérationnel après la livraison des équipements ;
- (h) Le projet de guide des bonnes pratiques d'entretien pour les programmes de formation, prévu pour décembre 2022 ; a été préparé, mais il est toujours en cours de révision et de commentaire ; et
- (i) Le développement d'un système de suivi des frigorigènes basé sur des codes QR pour les bonbonnes de frigorigène a été entamé, mais n'est pas terminé ; les codes QR pour les bonbonnes de frigorigènes devraient devenir obligatoires d'ici 2026.

20. Les activités suivantes n'ont pas commencé :

- (a) Les activités relatives au programme de formation sur site aux bonnes pratiques d'entretien pour les petits ateliers employant un ou deux techniciens et consommant deux à trois bonbonnes de frigorigène par mois n'ont pas commencé ; Entre 150 et 200 techniciens devaient être formés et recevoir un certificat de participation. Ces formations seront suppléées par des formations supplémentaires aux petits ateliers dans le cadre de la quatrième tranche ; et
- (b) L'Égypte a décidé d'introduire le Permis de conduire les frigorigènes (RDL) en tant que

---

<sup>6</sup> Comme souligné par le Ministère de la coopération internationale, les nouvelles villes du pays seront établies dans le cadre du programme de villes intelligentes, qui seront alimentées par des énergies renouvelables et des technologies intelligentes, des infrastructures durables et écologiques et connectées à des réseaux de transport multimodaux (<https://sponsored.bloomberg.com/article/ministry-of-international-cooperation/egypts-new-cities> ; consulté le 10 avril 2024).

programme national de certification parallèle dont le lancement du pilote était prévu pour 2022 ; le pays poursuivra son programme de certification des services après-vente et pourrait introduire le RDL en 2029.

### *Mise en œuvre et suivi des projets*

21. L'unité de mise en œuvre et de supervision du projet (PMU) coordonne et supervise la mise en œuvre du PGEH, dont les visites des bénéficiaires et des parties prenantes, l'organisation d'ateliers et de réunions, et la préparation des rapports pertinents. Les décaissements dans le cadre de l'unité de mise en œuvre et de supervision du projet pour la troisième tranche s'élèvent à 125 702 \$ US (sur les 245 000 \$ US alloués), comprenant les coûts opérationnels et de personnel (86 880 \$ US), de consultants (13 822 \$ US), de soutien aux conversions dans le secteur de la climatisation domestique (10 000 \$ US), et les imprévus (15 000 \$ US).

### Niveau de décaissement des fonds

22. En date de mars 2024, sur le montant de 17 361 573 \$ US approuvé jusqu'ici, 10 815 162 \$ US ont été décaissés (7 236 700 \$ US pour l'ONUDI, 2 639 762 \$ US pour le PNUD, 731 400 \$ US pour le PNUE et 207 300 \$ US pour l'Allemagne), comme l'indique le Tableau 2. Le solde qui s'élève à 6 546 411 \$ US devrait être décaissé entre 2024 et 2026.

**Tableau 2. Rapport financier de la phase II du PGEH pour l'Égypte (\$ US)**

| Tranche   |          | ONUDI             | PNUD             | PNUE           | Allemagne      | Total             | Taux de décaissement (%) |
|-----------|----------|-------------------|------------------|----------------|----------------|-------------------|--------------------------|

### Plan de mise en œuvre de la quatrième tranche de la phase II du plan de gestion de l'élimination des HCFC

23. Les activités dans le cadre de la quatrième tranche seront mises en œuvre entre juin 2024 et décembre 2026 et sont résumées dans le Tableau 3.

**Tableau 3. Résumé et coût des activités à mettre en œuvre dans le cadre de la quatrième tranche**

| Activité                           | Agence | Coûts (\$ US) |
|------------------------------------|--------|---------------|
| Fabrication                        | ONUDI  | 3 249 213     |
| Cadre politique et mise en vigueur | ONUDI  | 60 000        |
|                                    | PNUE   | 10 000        |
|                                    | PNUE   | 15 000        |
|                                    | PNUE   | 15 000        |

|   |  |       |                  |
|---|--|-------|------------------|
|   | Révision des normes et des codes locaux afin de soutenir le programme de l'endiguement et de la prévention des fuites de frigorigènes et organisation de quatre ateliers de sensibilisation auprès de 200 participants sur la mise en vigueur des codes révisés  | PNUE  | 40 000           |
| Entretien d'équipement de réfrigération | Approvisionnement de l'équipement d'entretien de réfrigération et de climatisation pour la mise à niveau de huit centres de formation (unités de récupération, pompes à vide, jeux de pinces Lokring, détecteurs de fuites, manomètres à 4 voies et outils d'entretien)  | ONUDI | 80 000           |
|   | Achèvement de l'approvisionnement de kits d'outils d'entretien portables pour les équipes de terrain et d'outils de soutien aux centres de services après-vente de cinq fabricants d'équipement de climatisation résidentielle (y compris trois dans le cadre de la présente tranche), et formation et certification de 100 techniciens après-vente                  | ONUDI | 50 000           |
|   | Organisation de dix ateliers supplémentaires de formation sur site pour former 150 à 200 techniciens aux bonnes pratiques d'entretien pour les petits ateliers employant un ou deux techniciens et consommant deux à trois bonbonnes de frigorigène par mois.  | ONUDI | 20 000           |
|   | Formation de 375 techniciens supplémentaires aux bonnes pratiques d'entretien des équipements de réfrigération et de climatisation   | PNUE  | 50 000           |
| Récupération et régénération            | Fourniture de 200 kits d'outils de récupération supplémentaires, comprenant des unités de récupération et des bonbonnes, et distribution de tous les kits d'outils aux ateliers d'entretien comprenant des techniciens certifiés   | ONUDI | 250 000          |
|   | Soutien au centre de régénération existant et établissement d'un second centre de régénération qui a déjà été identifié  | ONUDI | 150 200          |
| Sensibilisation                         | Organisation d'une campagne de sensibilisation pour les consultants, les sous-traitants et d'autres parties prenantes pertinentes à l'existence et à l'utilisation de technologies utilisant des frigorigènes de remplacement  | PNUE  | 15 000           |
| Gestion de projet                       | Dépenses opérationnelles et relatives au personnel, réunions, frais de déplacement, documentation et rédaction de rapports (90 000 \$ US), consultants, supervision et évaluation de la mise en œuvre et rapports de vérification (40 000 \$ US), soutien aux conversions dans le secteur de la climatisation domestique (35 000 \$ US), et imprévus (15 000 \$ US). | ONUDI | 180 000          |
|   | Réunions (9 000 \$ US), consultants (10 000 \$ US) et frais de déplacement (16 000 \$ US).   | PNUE  | 35 000           |
| <b>Sous-total (ONUDI)</b>               |  |       | <b>4 039 413</b> |
| <b>Sous-total (PNUE)</b>                |  |       | <b>180 000</b>   |
| <b>Total</b>                            |  |       | <b>4 219 413</b> |

## OBSERVATIONS ET RECOMMANDATION DU SECRÉTARIAT

### OBSERVATIONS

#### Rapport sur la consommation de HCFC

24. Le Secrétariat a cherché à comprendre les raisons pour lesquelles la consommation de HCFC-22 déclarée par le pays dans le secteur de l'entretien a quasiment triplé entre 2022 et 2023. Après de plus amples discussions, l'ONUDI a expliqué que cette augmentation était due à la constitution de stocks de HCFC-22 par les fournisseurs de frigorigènes en raison de la hausse prévue des prix de HCFC-22. Cette

hausse de prix était prévue en raison de l'importante réduction des quotas qui sera mise en œuvre en 2025, conformément aux objectifs spécifiés dans l'Accord entre le pays et le Comité exécutif.

Rapport périodique de la mise en œuvre de la troisième tranche de la phase II du plan de gestion de l'élimination des HCFC

*Cadre juridique*

25. Le gouvernement de l'Égypte a déjà émis des quotas d'importation de 241,08 tonnes PAO de HCFC pour 2024, ce qui est inférieur aux objectifs de réglementation du Protocole de Montréal et conforme aux objectifs fixés pour cette année-là dans l'Accord du PGEH.

*Activités dans le secteur de la fabrication*

Secteur de la fabrication des appareils de climatisation résidentiels

26. En examinant les mesures réglementaires prévues soumises lors de la 88<sup>e</sup> réunion conformément à la décision 84/72(e)(i)d, le Secrétariat avait considéré que ces mesures seraient insuffisantes pour permettre un essor réussi de la technologie d'ici l'achèvement de la phase II. Par conséquent, le Comité exécutif avait demandé à l'ONUDI, entre autres, de présenter dans le cadre de sa demande pour la quatrième tranche un cadre réglementaire détaillé afin de garantir l'essor de la technologie à faible PRP convenue (décision 88/70(a)(ii)a.). Par conséquent, l'ONUDI a fourni un résumé détaillé des réglementations du pays. En examinant ces informations, le Secrétariat a noté que le pays possède des réglementations robustes pour permettre la conformité avec les objectifs d'élimination du HCFC du Protocole de Montréal. Cependant, à l'exception des tarifs d'importation accordés au HFC-32 et aux frigorigènes à faible PRP, le Secrétariat comprend que le Gouvernement n'a pas encore mis en place de réglementations conçues pour permettre l'essor d'unités de climatisation résidentielle utilisant du HFC-32 face aux unités de climatisation résidentielle utilisant du R-410A sur le marché local.

27. De plus, tout en notant l'avancement de la conversion des lignes de production afin de permettre la fabrication d'unités de climatisation résidentielle utilisant du HFC-32, le Secrétariat a demandé des clarifications concernant les proportions relatives d'unités utilisant du R-410A et du HFC-32 qui étaient produites par les cinq entreprises. L'ONUDI a clarifié qu'entre le 1<sup>er</sup> janvier 2023 et le 13 mars 2024, les entreprises ont fabriqué un total de 1 294 642 unités de climatisation résidentielle, parmi lesquelles 507 (0,04 %) utilisaient du HFC-32.

28. Compte tenu de l'absence apparente de mesures réglementaires et de la fabrication limitée notée plus haut, et sachant que le pays a ratifié l'amendement de Kigali le 22 août 2023 et que l'ONUDI a prévu de soumettre la phase I du plan de mise en œuvre de l'amendement de Kigali relatif aux HFC à la 95<sup>e</sup> ou à la 96<sup>e</sup> réunion, le Secrétariat a cherché à mieux comprendre le lien entre le calendrier de fabrication d'unités de climatisation résidentielle à faible PRP pour le marché local dans le cadre du PGEH et les activités prévues dans le cadre du plan de mise en œuvre de l'amendement de Kigali relatif aux HFC. L'ONUDI a clarifié qu'en plus des cinq entreprises fabriquant des unités de climatisation résidentielle en cours de conversion dans le cadre du PGEH, il y avait sept entreprises fabriquant des unités de climatisation résidentielle utilisant du R-410A ; que parmi ces sept entreprises, l'ONUDI estimait que six pouvaient être éligibles dans le cadre du plan de mise en œuvre de l'amendement de Kigali relatif aux HFC du pays, bien que cela reste à confirmer ; que l'intention du Gouvernement était d'inclure la conversion de l'intégralité du secteur de la fabrication des équipements de climatisation résidentielle au HFC-32 dans le cadre de la phase I du plan de mise en œuvre de l'amendement de Kigali relatif aux HFC et que le calendrier pour la mise en œuvre du KIP s'étendait de 2025 à 2029. L'ONUDI a de plus expliqué que, dans le cadre de la préparation du plan de mise en œuvre de l'amendement de Kigali relatif aux HFC, une étude détaillée et une collecte de données avaient été entreprises sur les entreprises supplémentaires de fabrication d'équipements de climatisation résidentielle ; ainsi, les données concernant la proportion relative de

fabrication d'unités de climatisation résidentielle au R-410A pour le marché local dans les cinq entreprises participant au PGEH par rapport aux sept entreprises restantes n'étaient pas encore disponibles.

29. En examinant la proposition lors de la 84<sup>e</sup> réunion, en raison d'une incompréhension involontaire, le Secrétariat avait compris que les cinq entreprises converties dans le cadre du PGEH constituaient l'intégralité du secteur de fabrication de climatisation résidentielle et, sur cette base, avait proposé un nombre de mesures politiques et réglementaires que le Gouvernement pourrait envisager afin de garantir la mise en œuvre réussie du projet ; par conséquent, le Comité exécutif avait noté l'engagement du Gouvernement à, entre autres : garantir le contrôle total des équipements de climatisation résidentielle utilisant du R-410A et du R-407C, importés ou en place dans le marché local ; sécuriser l'essor du HFC-32 et, si l'entreprise le décidait une fois la technologie disponible, du R-454B sur le marché local ; présenter un bilan des mesures réglementaires prévues ou introduites et un calendrier prévisionnel pour les entreprises afin qu'elles fabriquent exclusivement pour le marché local en utilisant du HFC-32 ou une substance de remplacement à faible PRP, dans le cadre de la demande de la troisième tranche en 2021 (décision 84/72(e)(i)b-d). Le Secrétariat ne saisit pas bien comment le gouvernement pourrait développer un cadre réglementaire détaillé afin de garantir l'essor de la technologie à base de HFC-32 si certaines entreprises ont converti leur fabrication pour le marché local au HFC-32 tandis que d'autres continuent à fabriquer des équipements utilisant du R-410A pour le marché local. Par exemple, le Secrétariat ne saisit pas bien si le gouvernement pourrait, comme proposé, imposer une taxe d'importation sur les équipements utilisant du R-410A alors que des entreprises dans le pays continuent à fabriquer de tels équipements étant donné les principes de non-discrimination de l'Organisation mondiale du commerce.

30. De plus, le Secrétariat a noté que le Gouvernement avait notifié le Secrétariat de l'ozone de son intention d'utiliser la dérogation relative aux hautes températures décrites aux paragraphes 26 à 37 de la décision XXVIII/2, qui incluent, entre autres, les équipements de climatisation résidentielle dans la liste des équipements exemptés.

31. En dépit des circonstances, le Secrétariat note qu'en général, quand les pays visés à l'Article 5 ont décidé de convertir leur climatisation résidentielle à la technologie à base de HFC-32, ces conversions ont été mises en œuvre. Le Secrétariat estime que l'engagement du Gouvernement et des entreprises ayant signé les contrats de surcoûts d'exploitation à respecter un calendrier de fabrication intégrale pour le marché local de technologie à base de HFC-32 d'ici le 1<sup>er</sup> janvier 2025 ou le 31 décembre 2026 significatif, et a noté avec satisfaction la confirmation que l'ONUDI ne paierait pas les surcoûts d'exploitation avant d'avoir vérifié que les entreprises fabriquaient bien des équipements utilisant du HFC-32, conformément à la décision 77/35(a)(vi). Par conséquent, il a été décidé que le Secrétariat recommanderait l'approbation du financement alloué au secteur de la fabrication de climatisation résidentielle dans le cadre de la quatrième tranche à l'exception des surcoûts d'exploitation convenus pour les deux entreprises n'ayant pas encore signé leur contrat de surcoûts d'exploitation (à savoir, Miraco et Power, pour lesquelles des surcoûts d'exploitation à hauteur de 1 454 835 \$ US et 284 280 \$ US avaient été convenus), étant entendu que l'ONUDI, au nom du Gouvernement, pourrait soumettre une demande pour le financement restant dans le cadre de la quatrième tranche (à savoir 1 739 115 \$ US) à la même réunion à laquelle il soumettra la phase I ou lors de la 96<sup>e</sup> réunion, à la première occurrence.

#### Secteur de la fabrication des appareils de climatisation commerciale

32. Le rapport soumis à la présente réunion indique que les unités hybrides IEC-H ouvrent de nouvelles voies pour des technologies de climatisation alternatives et fournissent un système alternatif aux applications de climatisation qui dépasse l'efficacité des systèmes à détente directe existants. Bien que le Secrétariat soit d'accord avec cette évaluation encourageante, et note que les autres pays visés à l'Article 5 et possédant une fabrication d'appareils de climatisation commerciale pourraient souhaiter examiner les conclusions du rapport, le Secrétariat a noté que le frigorigène utilisé dans les unités hybrides IEC-H était du R-410A et non du HFC-32 ou une des substances de remplacement à faible PRP convenues durant l'approbation du projet. L'ONUDI a expliqué que c'était en raison d'un manque de disponibilité de

composants clés (à savoir, des compresseurs et des détendeurs) à l'époque, mais que ces composants étaient désormais disponibles. Par conséquent, l'ONUDI prévoit de tester des unités utilisant du HFC-32 (et, si disponible, du R-454B) dans la zone climatique possédant les températures ambiantes les plus élevées au thermomètre sec et le plus faible taux d'humidité durant l'été 2024.

33. À la 79<sup>e</sup> réunion, il a été noté que la pérennité de la reconversion sur le secteur de la fabrication des climatiseurs commerciaux était l'une des principales préoccupations, étant donné que le marché utilisait déjà des HFC à fort PRP dans des unités monoblocs, des unités centrales et des refroidisseurs, y compris du HFC-134a et du R-410A. Il a donc été convenu que le Gouvernement présenterait, par l'intermédiaire de l'ONUDI, un rapport sur la mise en œuvre des politiques et des mesures pour garantir la pérennité de la reconversion, dans le rapport périodique sur la mise en œuvre des tranches de la phase II du PGEH, jusqu'à l'acceptation réussie dans le marché des solutions de remplacement.<sup>7</sup> À la 88<sup>e</sup> réunion, l'ONUDI a noté que la sélection de politiques et de mesures dépendait du succès de l'achèvement des activités d'assistance technique, dont la construction et les essais des prototypes, et du développement de la technologie hybride détente directe–évaporation indirecte (IEC-H), dont l'achèvement était prévu d'ici septembre 2022. Par conséquent, le Comité exécutif a demandé à l'ONUDI de présenter, dans le cadre de la demande pour la quatrième tranche, les mesures politiques proposées afin de garantir la pérennité de la conversion à des substances de remplacement à faible PRP dans le secteur de la fabrication des appareils de climatisation commerciale (décision 88/70(a)(ii)b.) L'ONUDI a indiqué que les mesures politiques seraient développées à la suite des tests supplémentaires prévus à l'été 2024. Le Comité exécutif pourrait aussi souhaiter prendre en considération toutes les informations relatives au secteur de la fabrication d'appareils de climatisation commerciale, y compris de possibles mesures politiques, au moment de son examen de la phase I du plan de mise en œuvre de l'Amendement de Kigali relatif aux HFC du pays, prévue d'ici la 96<sup>e</sup> réunion.

#### *Secteur de l'entretien de l'équipement de réfrigération*

34. Le Secrétariat a noté qu'un certain nombre d'activités prévues pour le secteur de l'entretien ont été retardées, notamment, entre autres, le développement d'outils réglementaires et institutionnels afin de mettre en vigueur le programme de certification et la formation et la sensibilisation aux normes et aux codes locaux ; la finalisation du guide pour les programmes de formation ; la certification de 500 techniciens dans le cadre du programme de certification pilote ; la finalisation de quatre codes nationaux ; l'inspection et la certification pilote de quelques bâtiments et la mise en œuvre des codes QR obligatoires pour les bonbonnes de frigorigène. Tout en notant que la pandémie de COVID-19 ait pu contribuer à certains de ces retards et que la mise en œuvre de certaines des mesures prévues était inédite et pourrait prendre du temps (à savoir le programme de certification des bâtiments, les QR codes pour les bonbonnes de frigorigène), le Secrétariat a invité instamment l'ONUDI et le PNUE à intensifier leurs efforts afin d'aider le pays, sachant la réduction importante des objectifs 2025 spécifiés dans l'Accord entre le pays et le Comité exécutif.

35. En examinant la proposition lors de la 79<sup>e</sup> réunion, le Secrétariat avait considéré la formation qui serait dispensée aux petits ateliers (à savoir les ateliers comprenant seulement un ou deux techniciens et consommant seulement deux ou trois bonbonnes de frigorigène par mois) comme particulièrement utile étant donné la capacité probablement limitée de ces ateliers. Le Secrétariat a de même encouragé l'ONUDI à intensifier ses efforts afin de dispenser les formations prévues dans le cadre de la troisième tranche et celles prévues dans le cadre de la quatrième tranche. Le Secrétariat a aussi noté qu'en fonction des résultats du programme de certification des services après-vente, le pays pourrait introduire le RDL en 2029.

36. Étant donné que le centre de régénération avait été identifié en 2021, le Secrétariat a cherché à mieux comprendre la raison du retard dans l'accord du permis nécessaire à son fonctionnement. L'ONUDI a clarifié que bien que le centre possède un permis pour remplir des frigorigènes, il ne possédait pas de permis pour des activités de régénération, qui constituaient une nouvelle catégorie d'opérations commerciales récemment créées par le Ministère de l'industrie. Bien que le second centre de régénération

<sup>7</sup> Paragraphe 50(b) du document UNEP/OzL.Pro/ExCom/79/32.

à être établi dans le cadre de la quatrième tranche ait aussi besoin d'un permis pour des activités de régénération, l'ONUDI ne prévoit pas que cela entraîne un retard, car cette nouvelle catégorie d'opérations commerciales a déjà été établie.

37. Il y a eu des retards de dédouanement des équipements achetés dans le cadre du projet, notamment pour les frigorigènes inflammables destinés au centre d'excellence. En particulier, bien que la plupart des équipements aient été dédouanés sans problème, certains outils étaient toujours en cours de dédouanement ; les ateliers de formation devant avoir lieu au centre d'excellence seront dispensés une fois les équipements livrés. Lors de la 93<sup>e</sup> réunion, le Comité exécutif a approuvé la prorogation au 30 juin 2024 de la date d'achèvement de la composante de formation mise en œuvre par l'Allemagne (EGY/PHA/84/INV/142). Le Secrétariat recommande de proroger le projet au 31 octobre 2024 afin de permettre le dédouanement de l'équipement restant nécessaire pour les formations et pour les formations d'avoir lieu.

#### Mise en œuvre de la politique d'égalité des genres

38. La phase II du PGEH a été approuvée avant l'approbation de la politique opérationnelle sur l'intégration des questions de genre (décision 84/92(d)). Toutefois, des ingénieures ont participé au projet de conversion à El-Araby et Fresh, et l'unité nationale de l'ozone (UNO) a mesuré la participation des femmes aux activités de formation (détaillée ci-dessous). Trois femmes ont participé aux ateliers de formation de formateurs et trois ingénieures ont reçu des certificats d'appréciation du Ministère de l'environnement, du Ministère de la main-d'œuvre et du Ministère de la solidarité sociale, soulignant leur contribution à l'organisation des ateliers de formation de formateurs et à la mise à niveau des centres de formation pour qu'ils soient capables de former aux frigorigènes inflammables. Il est à espérer que ces formations et certificats d'appréciation contribueront à encourager une participation accrue de formatrices et de techniciennes aux formations ultérieures. Le projet de programme de promotion de la politique d'égalité des genres préparé par l'UNO n'a pas encore été finalisé.

#### Pérennité de l'élimination des HCFC et évaluation des risques

39. Afin de garantir la pérennité de la conversion des secteurs des mousses de polystyrène extrudé et des mousses de polyuréthane, le gouvernement a mis en œuvre l'interdiction d'utiliser des HCFC dans la fabrication des mousses de polystyrène extrudé (depuis le 1<sup>er</sup> janvier 2023), d'importer du HCFC-141b (depuis le 1<sup>er</sup> janvier 2020) et du HCFC-141b contenu dans des polyols prémélangés (depuis le 1<sup>er</sup> janvier 2018). Le gouvernement a aussi interdit l'importation de HCFC-142b et de R-406A et a interdit l'importation et la fabrication d'équipements utilisant du HCFC depuis le 1<sup>er</sup> janvier 2023. Ces mesures et la mise en œuvre du système d'octroi de licences et de quotas du pays contribueront à garantir la pérennité de l'élimination des HCFC.

40. L'augmentation substantielle de consommation de HCFC-22 en 2023 était probablement due à une constitution de stocks ; cela ne devrait pas persister et pourrait réduire les importations de HCFC-22 en 2024 et 2025. Le Secrétariat a noté la réduction substantielle de consommation requise afin d'atteindre les objectifs 2025 et a encouragé l'ONUDI et le PNUE à poursuivre leur assistance au pays dans la mise en œuvre des activités prévues dans le cadre du PGEH qui aideront le pays à se conformer à son Accord avec le Comité exécutif.

41. Bien que le Secrétariat considère que les risques liés à la pérennité de l'élimination des HCFC dans les secteurs de la fabrication d'appareils de climatisation résidentielle et commerciale soient faibles, évaluer les risques relatifs à une conversion durable à des technologies à faible PRP dans ces secteurs est difficile étant donné l'utilisation dominante du R-410A dans le pays pour ces applications et en l'absence d'informations qui seront fournies quand le pays soumettra la phase I du plan de mise en œuvre de l'Amendement de Kigali relatif aux HFC, y compris : comment le pays appliquerait la dérogation pour température élevée dans ces secteurs s'il choisit de le faire ; une vue d'ensemble globale du secteur de la fabrication d'appareils de climatisation commerciale et résidentielle au R-410A dans le pays ; les

conversions additionnelles qui pourraient être intégrées dans le cadre de ce plan et les mesures politiques et réglementaires qui pourraient être intégrées dans le cadre de ce plan qui pourraient aider à faciliter l'essor sur le marché des technologies convenues dans le cadre du PGEH. Une soumission conjointe de la phase I du plan de mise en œuvre de l'Amendement de Kigali relatif aux HFC du pays et de la demande pour les 1 739 115 \$ US restants, plus les coûts d'appui d'agence pour l'ONUDI, permettra au Comité exécutif d'avoir une compréhension globale de ces sujets. Étant donné le solde restant à l'ONUDI, le Secrétariat estime que retarder l'examen du financement restant dans le cadre de la quatrième tranche à la 95<sup>e</sup> ou à la 96<sup>e</sup> réunion ne devrait pas retarder outre mesure l'achèvement de la conversion dans le secteur de la fabrication d'appareils de climatisation résidentielle. À l'inverse, le Secrétariat estime que l'approbation du financement demandé contribuera à permettre aux entreprises de fabrication d'appareils de climatisation résidentielle ayant signé des contrats de surcoûts d'exploitation de fabriquer exclusivement des équipements de climatisation résidentielle au HFC-32 pour le marché local d'ici le 1<sup>er</sup> janvier 2025 ou le 31 décembre 2026. Ce calendrier, qui est plus rapide que celui indiqué au tableau 3 du document UNEP/OzL.Pro/ExCom/88/47, contribuera à renforcer la confiance dans la technologie et devrait faciliter des conversions ultérieures.

### Conclusion

42. Le système d'octroi de licences et de quotas d'importation du pays est opérationnel, et la consommation vérifiée pour 2021, 2022 et 2023 est inférieure aux objectifs définis dans l'Accord du pays avec le Comité exécutif. Les conversions dans les secteurs de la fabrication des mousses de polystyrène extrudé et des mousses de polyuréthane sont achevées et le Gouvernement a mis en œuvre un certain nombre d'interdictions afin de soutenir l'élimination des HCFC. Le niveau de décaissement de la troisième tranche s'élève à 27 pour cent, et à 62 pour cent du financement approuvé à ce jour. Bien qu'une assistance technique ait été mise en œuvre afin d'assister les fabricants d'appareils de climatisation commerciale du pays à fabriquer des équipements basés sur une nouvelle technologie hybride détente directe-évaporation indirecte (IEC-H), les entreprises ne fabriquent pas encore de tels équipements avec du HFC-32 ou des substances de remplacement à faible PRP. Des essais supplémentaires, prévus pour l'été 2024 devraient permettre une telle fabrication. De plus, bien que des équipements dédiés à la fabrication d'unités de climatisation résidentielle utilisant du HFC-32 aient été installés dans quatre des cinq entreprises participant au PGEH, la fabrication pour le marché local dans ces entreprises reste presque exclusivement basée sur le R-410A et des entreprises supplémentaires fabricants des unités de climatisation résidentielle utilisant du R-410A pour le marché local ont été identifiées. Le Secrétariat estime que la ratification de l'amendement de Kigali par le pays et la décision du Gouvernement d'accorder les surcoûts d'exploitation uniquement aux entreprises fabriquant exclusivement des unités de climatisation résidentielle à base de HFC-32 pour le marché local d'ici le 31 décembre 2026 (ou plus tôt) constituent des signaux importants pour l'industrie et le marché et devraient contribuer à permettre leur conversion au HFC-32. Étant donné la réduction substantielle des objectifs 2025, des efforts continus et constants de la part du Gouvernement avec le soutien de l'ONUDI et du PNUE seront nécessaires pour s'assurer que le pays continue à respecter les objectifs spécifiés dans son Accord avec le Comité exécutif.

### **RECOMMANDATION**

43. Le Comité exécutif pourrait souhaiter envisager :
- (a) Prendre note du rapport périodique sur la mise en œuvre de la troisième tranche de la phase II du plan de gestion de l'élimination des HCFC (PGEH) pour l'Égypte ;
  - (b) D'approuver la prorogation au 31 octobre 2024, de la date d'achèvement de la phase II du PGEH de l'Égypte (deuxième tranche) (EGY/PHA/84/INV/142) afin de permettre l'achèvement des activités en cours restantes ; et
  - (c) D'approuver, pour la quatrième tranche de la phase II du PGEH de l'Égypte, un montant

de 2 662 825 \$ US, comprenant 2 300 298 \$ US, plus les coûts d'appui d'agence à hauteur de 161 021 \$ US pour l'ONUDI, et 180 000 \$ US, plus les coûts d'appui d'agence à hauteur de 21 506 \$ US pour le PNUE, et le plan correspondant de mise en œuvre de la tranche pour 2024-2026, étant entendu que l'ONUDI, au nom du Gouvernement, soumettra la demande de financement restant pour la quatrième tranche d'un montant de 1 739 115 \$ US, plus les coûts d'appui d'agence à hauteur de 121 738 \$ US pour l'ONUDI, lors de la même réunion que la soumission de la phase I du plan de mise en œuvre de l'Amendement de Kigali relatif aux HFC du pays ou lors de la 96<sup>e</sup> réunion du Comité exécutif, à la première occurrence.

## Background

This component covers the risk assessment of the places where explosive atmospheres may occur by classification of areas followed by arrangements to deal with accidents and emergencies, in addition to instructions and training for people in the area, along with the design and installation of safety systems.

**Residential Air Conditioning Risk Assessment from 1 to 3 ton using R32 chosen as a model in Egypt which considered a HAT country (High Ambient Temperature).**

### 1- Flammability definition and classes

For a fire to happen there needs to be three elements: a rapid leak of the flammable gas, a concentration higher than the lower flammability level, and a source of ignition as shown in figure below.

Figure 1 shows the probability of ignition as the resultant of these three elements. Lower Flammability Limit (LFL), usually expressed in volume per cent, is the lower end of the concentration range over which a flammable gas can be ignited at a given temperature and pressure.

**Figure 1: FACTORS AND PROBABILITY OF IGNITION**

Probability = [rapid Leakage] x [High Concentration] x [Ignition Source]

Flammability Classification for Refrigerants: Table 1 shows the classes of flammability as defined in ISO 847 and ASHRAE 34.

**TABLE 1: FLAMMABILITY CLASSIFICATION FOR REFRIGERANTS**

| Class |  |
|-------|--|
| 1     | No flame propagation when tested at 60°C and 101.3 kPa                   |
| 2     | Flame propagation and LFL > 0.1 kg/m <sup>3</sup> and HOC < 19,000 kJ/kg |
| 2L    | Same as 2 except Burning Velocity < 10 cm/s                              |
| 3     | Flame propagation and LFL ≤ 0.1 kg/m <sup>3</sup> and HOC ≥ 19,000 kJ/kg |

## 2- Definition of Risk

- **Risk** is a combination of the probability of concurrence of harm and the severity of that harm.
- **Tolerable risk** is the level of risk that is accepted in a given context based on the current acceptable values by a community.
- **Residual risk** is the risk remaining after reduction measures have been implemented. Safety is freedom from risk which is not tolerable.

The risk levels depend on the severity of injury, the amount of damage to the environment, the frequency at which people are exposed to the danger and the duration of exposure.

Tolerable risk is determined by the search for an optimal balance between the ideal absolute safety and the demands to be met by a product. The factors influencing risk are the practicality and means to reduce risk, the benefit to users, cost effectiveness, and social conventions.

The concept of tolerable vs. unacceptable risk was introduced based on the probability of harm and the severity of harm as per Figure 2.

FIGURE 2: TOLERABLE VS. ACCEPTABLE RISK (SOURCE: UL)

## 3- Process of a Risk Assessment Model

The Risk Assessment model is based on the workshop that was held in Japan in cooperation with Japan Refrigeration and Air Conditioning Industry Association (JARAIA) in April 2019. The workshop was dedicated to the study of a risk scenario prepared by the PRAHA team, and also the following should be taken into consideration;

- An outline of the methodology and the components that are the basis for the risk assessment model.
- A model of what data can be collected.

- Information on the regulatory regime and the enforcement mechanisms.
- International standards play a role in the next step of risk assessment in the form of recommendations for local standards.
- Rigorous regulations as those adopted in other regions must be adapted to HAT countries.
- Stakeholders: governments and local research institutions, industry and private sector, and UN Environment & UNIDO.

### 3.1. Selection of equipment type and Life stage for the risk assessment model

Residential air conditioning unit is chosen, as it is the most used type in number of units and where the risk might be greatest, also servicing of the indoor unit as the most relevant for the model. Figure 3 identify the life stages of the residential air conditioning.

FIGURE 3: AC LIFE STAGES

### 3.2. Procedure of Risk Assessment

The process that will be used is outlined in Figure 4, according to ISO/IEC 51 (Source: JRAIA)

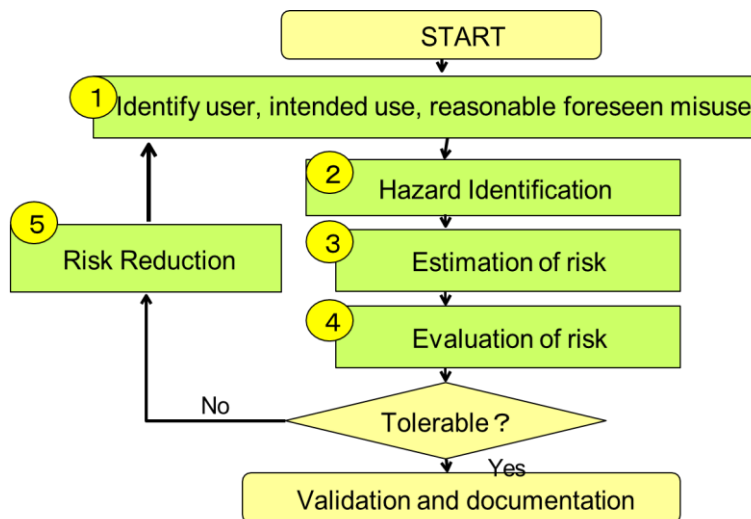

FIGURE 4: PROCEDURE OF RISK EVALUATION

### 3.3. Acceptable and tolerable risk:

Tolerable risk depends on the number of units in the market of the product identified, also on the frequency and severity of the accident.

JRAIA defines risk in terms of probability and frequency vs. severity. A low risk is where the probability of an accident is lower and the severity is least. An extreme risk is where the probability is high and the severity is also high.

Table 2 shows the frequency of accidents vs. severity. Frequent accidents leading to catastrophic events are the least acceptable, while improbable or incredible (as in incredibly low frequency) with the least severity are socially acceptable.

**TABLE 2 RISK MATRIXES - FREQUENCY VS. SEVERITY (SOURCE JRAIA)**

|  | None | Negligible<br>(slight injury)                            | Marginal (need<br>for outpatient<br>treatment) | Critical (serious<br>injury or need to<br>be hospitalized) | Catastrophic<br>(death) |
|--|------|--|--|--|-------------------------|
| <b>Frequent</b>                                      | C    | B3   | A1   | A2   | A3                      |
| <b>Probable</b>                                      | C    | B2   | B3   | A1   | A2                      |
| <b>Occasional</b>                                    | C    | B1   | B2   | B3   | A1                      |
| <b>Remote</b>  | C    | C  | B1   | B2   | B3                      |
| <b>Improbable</b>                                    | C    | C  | C  | B1   | B2                      |
| <b>Incredible</b>                                    | C    | C  | C  | C  | C                       |
| A = Unacceptable risk levels:<br>1=least, 3= highest |      | B= Risk levels should be reduced<br>1= least, 3= highest |  | C= Socially acceptable risk levels                         |                         |

### 3.4. Product Cycle

The life cycle range for assessment is shown in Figure 5. Each stage has to be assessed separately and added together to get to the total risk.

**FIGURE 5: LIFE CYCLE RANGE FOR ASSESSMENT**

The determination of tolerable risk depends on the population of products in the country. The example from Japan is in Table 3:

**TABLE 3: DETERMINATION OF TOLERABLE RISK LEVELS**

| Product/System | Unit Population | Tolerable risk      |                    |
|----------------|-----------------|---------------------|--------------------|
|                |                 | Usage stage         | Service stage      |
| Residential AC | $1 \times 10^8$ | $1 \times 10^{-10}$ | $1 \times 10^{-9}$ |

The JRAIA approach is used to set the tolerable risk for residential units at the following levels:

For the usage stage = 1 / 100 x unit population

For the service stage = 1 / 10 x unit population

And the risk map becomes as in Figure 6:

**FIGURE 6: RISK MAP**

#### 4- Risk Scenarios

A critical stage of the risk assessment is to identify those scenarios in which an ignition source is present in conjunction with a flammable concentration of leaked refrigerant. To better understand these scenarios, one must consider the various triggering events which could cause refrigerant to be released, the location of the release, and the specific type of person that might be present (i.e., a worker, repair person or customer) at the time of the release. It is important to note that, during normal operations, the refrigerant will be contained within the system, and thus there is no risk of adverse events associated with these refrigerants during regular use.

However, if refrigerant leaks from the equipment and is not dispersed prior to accumulating to a flammable concentration and a sufficient energy source is present, refrigerant ignition could occur (AHRTI 8009)

The fault tree analysis (FTA) is chosen.

The risk assessment of flammable refrigerants considers two individual phenomena: the presence of an ignition source and the generation of a flammable volume. The risk scenarios that were considered were:

A. Refrigerant leak during maintenance work on the indoor unit during brazing and due to pipe breakage by corrosion with an ignition source caused by live wire, static electricity, or electric tool such as screw drivers

B. Refrigerant leak during brazing of outdoor unit with leakage caused by prior maintenance work or during maintenance work and an ignition source from the brazing torch;

C. Refrigerant leakage during normal home use caused by pipe breakage through corrosion, external pressure or natural causes such as earthquakes with an ignition source of an open flame, electric spark or static electricity.

#### **5- Select Risk Analysis Sources**

The input into the model is taken from data tables for the type of application and usage of the equipment that are being studied. Source for input into the volume of the flammable cloud can be taken from research done for the type of gas. Data for source and time of ignition can sometimes be available from the fire department.

#### **6- Data Collection**

Data collection takes into consideration the following:

a) Select the stages of the life cycle of the air conditioners. Choose the manner of classification of manufacturing, transportation, use, service, and disposal of an air conditioner into separate stages for evaluation. The evaluation of the manufacturing stages of each product is normally the responsibility of the manufacturer.

b) Investigate the conditions of installation of the selected air conditioner to determine the conditions to be evaluated during the risk assessment.

c) Determine the severity of the hazard focusing on the damage caused by flammability.

d) Set tolerance levels. Set socially acceptable probability of harm for the air conditioner.

e) Investigate refrigerant leakage rate, speed, and amount based on surveys conducted with air conditioning service companies. The initial leakage location and leakage concentration should also be determined.

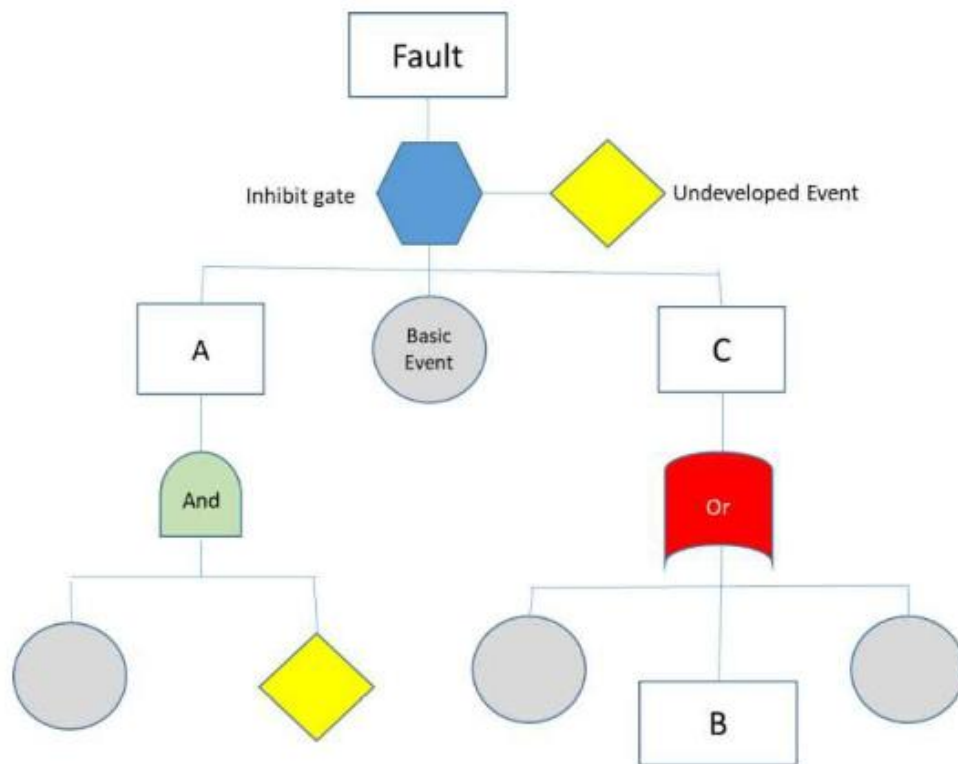

f) Determine flammable time volume through CFD or calculations. For the conditions set as per point (b), the flammable time volume can be calculated by CFD simulation based on the leakage amount, speed, and concentration of the refrigerant as per point (e).

g) Consider ignition sources. Distinguish the ignition properties depending on whether the ignition source is a spark (for example, electrical contacts, lighter, and/or static electricity), or an open flame (for example, candles, matches, and/or combustion equipment).

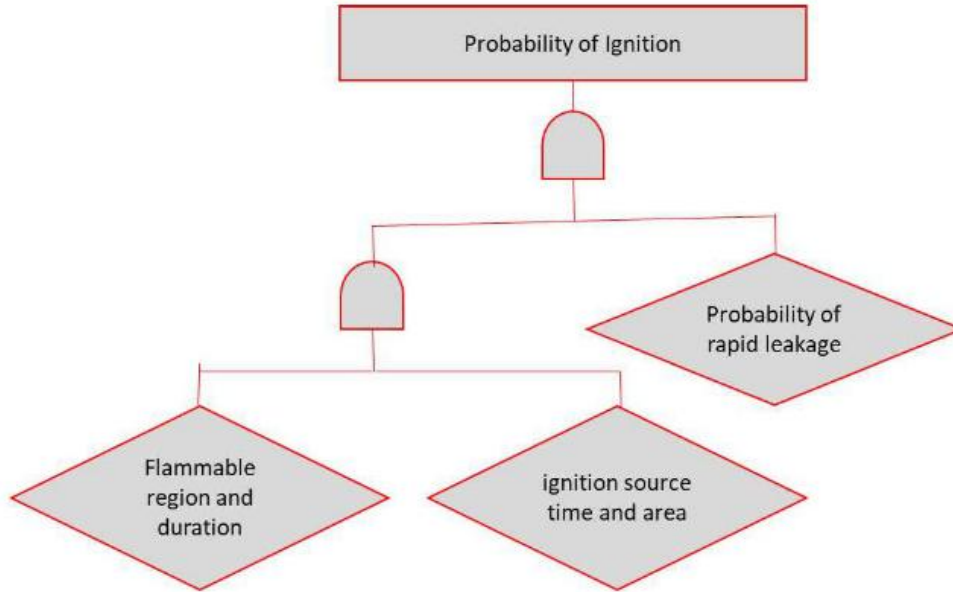

## 7- Fault Tree Analysis (FTA)

It utilizes a "top-down" approach, starting with the undesired effect as the top event of a tree of logic. Fault trees (FTs) consist of various event boxes, which reflect the probability or frequency of key events leading up to a system failure. The event boxes are linked by connectors (gates), which describe how the contributing events may combine to produce the system failure. Events may be combined in different ways: in cases where a series of events must all occur to produce an outcome (e.g., ignition source and sufficient oxygen to support combustion), the probabilities or frequencies of the individual contributing events are multiplied via an "AND" gate; in cases where only one of a series of events is needed to produce an outcome (e.g., a strong spark, open flame, or a hot surface all possibly leading to refrigerant ignition), the probabilities are usually added via an "OR" gate. (AHRTI 8009, 2015).

**FIGURE 7: FAULT TREE ANALYSIS (FTA) MODEL**

In the case of flammability, the probability of leakage is combined with (“and” gate) the possibility that the length of time that flammable cloud exits covered area would lead to ignition in case of the existence of an ignition source (another “and” gate).

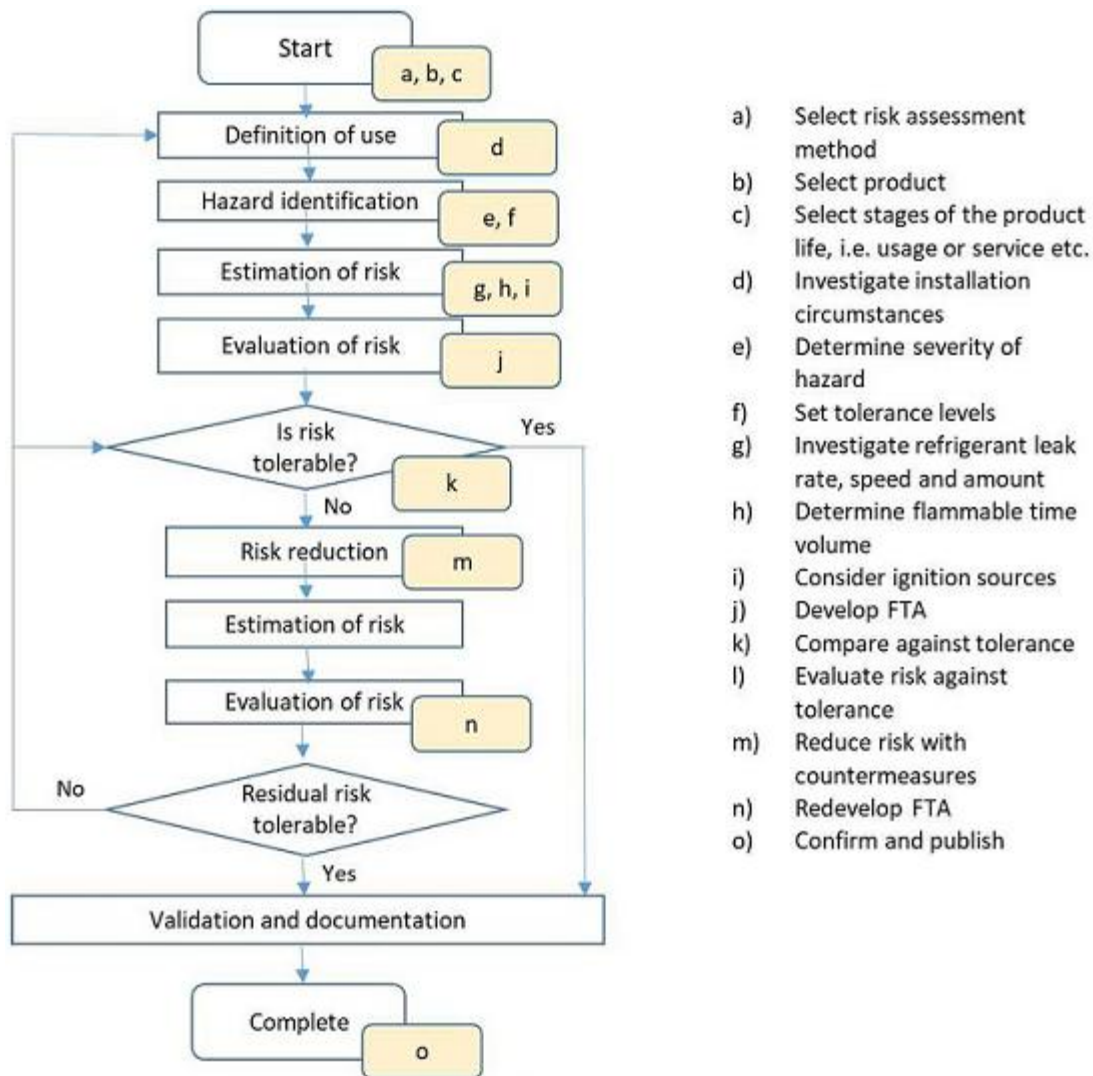

**FIGURE 8: PROBABILITY OF IGNITION FTA**

**8- Suggest Measure to Mitigate Intolerable Risk**

When the tolerance from the risk evaluation in the steps above is satisfactory, the risk assessment ends.

If the risk exceeds the tolerance, countermeasures to reduce the risk should be taken. These countermeasures include the implementation of regulations and other measures like introducing safety procedures in order to reduce the risk of accidents. In some instances, it might be necessary to revise laws and regulations in order to ensure that they cover the accepted probability. The reiterative process, which is explained in Figure 9, is as follows:

**FIGURE 9: FTA ITERATIVE PROCESS**

- Once the countermeasures have been introduced, the FTA factors are reviewed and these countermeasures are added in the appropriate position of the tree.
- A new calculation can then be made and repeated until the calculations confirm the accepted tolerance according to the risk map.
- The results can then be released to the public and standards and codes can be drawn.

**9- Type of premises that residential AC applications likely to be deployed in.**

- 3.1. Governmental offices
- 3.2. Barber shop
- 3.3. Home use
- 3.4. Retail shop
- 3.5. Educational premises

## 10- Data analysis of potential risks with Example of a Risk Assessment Model

Case study of an office space in a government building during the usage phase when the equipment is running and during the repair/service stage. The target product is a 5.3 kW split system using an A2L (R32) refrigerant. Fault Tree Analysis (FTA) method is selected. The target product and the indoor and outdoor conditions plus the service case are shown in the tables below.

The two cases study using the information provided by the PRAHA team for the Egyptian model is:

- During usage of an air conditioner in a government office. The sources of ignition are extreme including charcoal and lighter used for incense burning, an aroma candle, as well as cigarettes and lighters as smoking is still allowed.
- During the repair stage during brazing with sources of ignition including the brazing burner, a cigarette and a lighter.

**Table 4 lists the equipment as well as the indoor and outdoor conditions**

| Target Product  |  | Value          |
|---|--|----------------|
| Model number  |  | CS-PC36JKF     |
| Type(cooling / HP)  |  | HP             |
| Capacity(kW)  |  | 10.5           |
| Refrigerant type  |  | A2L            |
| Refrigerant amount(kg)  |  | 2.7            |
| Alternative refrigerant type  |  | HFC-32, R-454B |
| Indoor Condition during usage of target product                         |  | Value          |
| Room size (m <sup>2</sup> )   | max                                      | 25             |
|   | min                                      | 16             |
| Height of installation(m)   |  | 2.1            |
| Ceiling height(m)   |  | 2.8            |
| Ventilation   | yes/no                                   | YES            |
|   | Ventilation amount (m <sup>3</sup> /hr.) | 80             |
| The area of the gap under the door (m <sup>2</sup> )                    |  | 0.02           |
| other openings, if any (m <sup>2</sup> )                                |  | 0              |
| Outdoor Condition during usage of target product                        |  | Value          |
| Size of the place enclosed with walls , or fences etc.(m <sup>2</sup> ) | max                                      | 8              |
|   | min                                      | 4              |

| Condition during repair of target product                       | value  |
|---|--------|
| Average size of outdoor spaces for repairs (m <sup>3</sup> )    | 20     |
| Percentage of single outdoor unit installations( A%)            | 50     |
| Percentage of the installations of multiple outdoor units ( B%) | 50     |
| Average working hours per repair (outdoor unit) (hr.)           | 1      |
| Average working hours per repair (indoor unit)(hr.)             | 0.5    |
| Wind condition (wind velocity) (m/s)                            | 1 TO 3 |
| Windless condition percentage (%)                               | 10     |

**(Windless condition; 0.1m/s or less. the windless rate in one year.)**

Notes:

- Ventilation amount was calculated based on 1.5 air changes per hour;
- Gap under door was based on the door width is 1.00 m, gap with floor is 2 cm;
- The outdoor unit was assumed to be installed on a roof open area.

The methodology is to calculate the probability of ignition due to a space factor and a time factor.

#### Space Factor

The space factor takes into consideration the space volume, the volume of the flammable cloud, and the volume of the source of ignition. The volume of the flammable cloud depends on the leakage rate and other considerations such as pressure. The volume of the source of ignition can be very small as in the case of a spark, or sizeable as in the case of an open flame.

#### Time Factor

The time factor takes into consideration the number of occurrences of the ignition source and the duration of each occurrence.

#### Simulation of Time Factor and Space factor During Usage Stage

The data in Table 5 was provided by the PRAHA-II team for the Egyptian model.

**TABLE 5: DATA FOR THE CALCULATION OF RISK FOR USAGE STAGE**

| Event | Ignition source    | No. of Occurrence | Duration per day | T <sub>s</sub> = Time of Source |
|-------|--------------------|-------------------|------------------|---------------------------------|
| A     | Charcoal + lighter | 2                 | 1 hour           | 1 hr/2                          |
| B     | Cigarette+ lighter | 2                 | 0.2 hour         | 0.2 hr/2                        |
| C     | Aroma candle       | 4                 | 3 hours          | 3 hr/4                          |

The FTA calculation for the usage stage is shown in Figure 10.

**FIGURE 10: FTA FOR USAGE STAGE**

For each event, i.e. charcoal, oil lighter, and aroma candle the probability of time and space are calculated according to **Fault Tree Analysis (FTA)** for the usage stage.

The calculation made by JRAIA during the workshop puts this Total calculated probability in the “Extremely Difficult” area of Figure 6: Risk Map.

### Simulation of Time Factor and Space factor During Servicing Stage

**TABLE 6: DATA FOR CALCULATION OF RISK FOR SERVICE STAGE**

| Event | Ignition source | No. of Occurrence | Duration per day | $T_s = \text{Time of Source}$ |
|-------|-----------------|-------------------|------------------|-------------------------------|
| A     | Burner          | 2                 | 2 minutes        | 4/2                           |
| B     | Cigarette       | 2                 | 3 minutes        | 6/2                           |
| C     | Lighter         | 2                 | 10 seconds       | 0.167/2                       |

The FTA for servicing stage is shown in Figure 11.

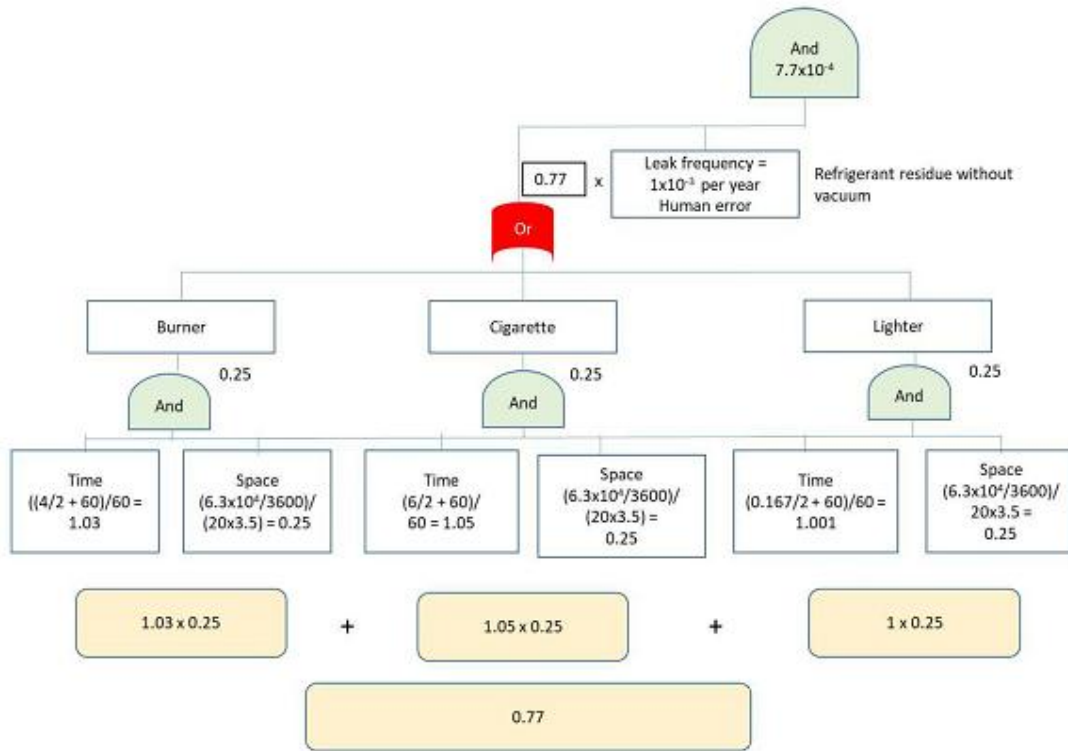

FIGURE 11: FTA FOR SERVICING STAGE

The calculation made by JRAIA during the workshop puts this Total calculated probability in the “Frequent” area of Figure 6: Risk Map and mitigation measures should be taken. One evident measure is to ban smoking in the service area!

11- Flammable gas region

FIGURE 12: Flammable gas region

### 11.1. Flammable gas region of the wall mounted AC unit:

- Flammable region can only be seen near the unit.
- The small flammable region existed below the air outlet of indoor unit only.
- The flammable gas volume was small.
- After leakage, the flammable region vanished in less than a second.

FIGURE 13: Flammable gas of the wall mounted AC

### 11.2. Flammable gas region of the floor mounted AC unit:

- Flammable region appears on the floor.
- There was a large flammable region spread on the floor.
- The flammable region did not vanish for some time.

FIGURE 14: Flammable gas of the floor mounted AC

## 12- Conclusions and Recommendations from the Risk Assessment Element

The above two FTA were created in collaboration with HAT countries (Egypt, Kuwait) and Japan. The simulated risk scenario considers climate, product-usage, lifestyle and culture of the Egyptian market. The exercise has shown the need for a reliable data on leaks, practices etc.

Building a risk assessment model for Egypt which suits the climate and the service practices of the local technicians helps in understanding the risk associated with flammable refrigerants and adopting the needed regulations and training programs especially in relation to the logistics of lower-GWP based technologies i.e. installation, transportation, storage, servicing and decommissioning. The Measures to mitigate risks would depend on type of existing/operational standards and/or codes in Egypt.

The mini-split risk assessment for R32 in residential air conditioners, confirming that;

- The simulation of Time Factor and Space factor During Usage Stage indicate that the total calculated probability in the “Extremely Difficult” area of Figure 5: Risk Map.
- It can be used if certain measures are adhered.
- In order to reduce the risks, the manuals used during installation or servicing should be carefully reviewed.
- More precisely, in the “Piping construction manual for residential air conditioners using R32 refrigerant” measures should be adopted.
- Flammable region and concentration distribution for the wall mounted AC unit is relatively better compared with floor mounted type.

The recommendation is to continue the risk assessment based on actual situations, and reduce the risk by implementing various measures that are verified by FTA.

It is also important to minimize ignition probability by implementing various measures that are verified by FTA.

In addition, the risk assessments of other stages matching cultural and lifestyle aspects should be studied.

### ➤ Risk Management Plan – RMP

It is recommended to implement a Risk Management Plan during service of AC units having A2L refrigerants, Annex 1 contain a template as a guide line, and the following control measure can be applied;

- 1- Warning signs must be placed during service time.
- 2- Ensure to open windows during service for well ventilation to ensure that the refrigerants are not concentrated to a large extent in case of a leak.
- 3- Using a portable detector to sense a leakage of refrigerant gases and give an alert if a leak is detected.

- 4- Maintaining a record in which all the details and actions that have been performed on each air conditioning unit, including maintenance, modification, recharging, repairs, and welds, are recorded by date and time.
- 5- Making an emergency plan to deal with any leaks that might go wrong during service activities.
- 6- Avoid any source of ignition inside the place.
- 7- All technicians must be aware of the risks posed by the presence of flammable refrigerant, and familiar with the applicable safety procedures.
- 8- All technicians must have training on the proper use of personal protective equipment (PPE), and how to use fire extinguishers.
- 9- Providing suitable fire extinguishing means to extinguish the different types of dangers present in the place.
- 10- Ensure that all electrical connections inside the place are off during the service time to avoid any electrical sparks to occur.
- 11- Manufacturers are required to include additional safety information in the installation and service manuals for air conditioners using flammable refrigerant. Technicians should follow these instructions.
- 12- Check the relevant material safety data sheets available from refrigerant wholesalers for specific safeguards when handling R32.
- 13- The electrical installation must be in accordance with the NEC and any local codes. This includes using the correct size wire and breaker for the circuit, and ensuring that the wiring is properly grounded.
- 14- Dry nitrogen should always be used when brazing to displace the oxygen and prevent oxidization on the inside of the pipework. This procedure is important as it is also required to displace the residual refrigerant and prevent concentration levels conducive to ignition.
- 15- Safety issues to be aware of when handling R32
- 16- Technicians need to take the relevant safety measures for the correct transport, storage, and handling of flammable gases. This includes ensuring that the gas is not exposed to open flames or other ignition sources. Toxic substances like hydrogen fluoride and carbon dioxide are created when R32 is burnt. Asphyxiation and freeze burns are also a risk.  
For transportation purposes, R32 is classified as a dangerous goods class A2L flammable gas, therefore requires additional handling and storage safeguards.

➤ **Equipment Safety**

- All equipment must be inspected regularly.
- Nitrogen must be used instead of air for leak testing.
- All equipment must be labeled with the type of refrigerant used.
- Refrigerants must be disposed of properly.

# Risk management plan for refrigerants

## The significance of a RMP.

Businesses need to be aware of their risks. Overall business success depends largely on effective management and minimization of risk – refrigerant is no different.

Under the Ozone Protection and Synthetic Greenhouse Gas Management it is important to apply a risk management plan (RMP), which outlines the handling and storage of refrigerant in the holder's business.

## RMP to include.

An RMP must identify potential risks which could result in the emission of refrigerant to the atmosphere and identify processes and practices that minimize the possibility of those risks occurring. RMP must reflect the risks of emissions relevant to all parts of the business practices, including refrigerant handling, storage and transport. These apply whether the business is for a sole trader or employ 100 or more technicians.

### Apply it for a specific business practices and do the following:

- Identify the type of works field
- Insert relevant person responsible against each risk
- Insert review date
- Read over the whole plan carefully and put lines through the areas that don't relate to your business. In particular, see the section 'Decommissioning end of life equipment'.
- Add further risks and control measures if relevant to your business.

# Risk Management Plan

| Activity steps  | Potential hazards/risks   | Risk control measures  | Standards and Code of practice reference | Person responsible (full name) | Next review date (within 12 months) |
|---|---|--|--|--------------------------------|-------------------------------------|
| Purchase of refrigerant   | Loose, damaged or missing cylinder caps   | <ul style="list-style-type: none"> <li>At time of purchase check that refrigerant cylinders are tightly capped</li> <li>Ensure quarterly purchase records are kept up to date</li> <li>Only accept refrigerant cylinders from wholesalers if they are properly sealed (bunged or capped).</li> </ul>   | ✓  |                                |                                     |
|   | Poor cylinder condition (rusted, corroded, damaged). Expired, or close to expired 'Test Date' | <ul style="list-style-type: none"> <li>Check cylinder date markings/imprints – specifically, that they are 'In Test'</li> <li>Good condition etc.</li> </ul>   | ✓  |                                |                                     |
| Transportation of refrigerant   | Damaged cylinder during transportation  | <ul style="list-style-type: none"> <li>Keep out of direct sunlight and/or in cooler area of vehicle</li> <li>Safely stored/fixd when transporting</li> <li>Fitted with safety equipment etc.</li> </ul>  | ✓  |                                |                                     |
|   | Damage to gas cylinders during handling (hand-moved, equipment-moved)                         | <ul style="list-style-type: none"> <li>Implement proper handling techniques</li> <li>Report accidents immediately.</li> </ul>  | ✓  |                                |                                     |
| Using equipment containing refrigerant                                    | Leakage of refrigerant during charging of equipment   | <ul style="list-style-type: none"> <li>Implement best practice procedure as per Standard and/or code of practice</li> </ul>  | ✓  |                                |                                     |
|   | Improper care of cylinders  | <ul style="list-style-type: none"> <li>After each use check that refrigerant cylinders are tightly capped</li> <li>Check for leakage etc.</li> </ul>   | ✓  |                                |                                     |
| Handling  | Unlicensed handling staff or contractors  | <ul style="list-style-type: none"> <li>All refrigerant handling must be carried out by qualified licensed staff or contractors</li> <li>Check temporary contractor's license before commencement of refrigerant handling work</li> <li>Ensure quarterly refrigerant handling license holder records are up to date, taking particular note of expiry dates.</li> </ul>   | ✓  |                                |                                     |
| Installation, service and maintenance of equipment containing refrigerant | Lack of servicing of equipment containing refrigerant   | <ul style="list-style-type: none"> <li>Adhere to manufacturers' recommendations and relevant standards</li> <li>Maintain recommended servicing frequency:                             <ol style="list-style-type: none"> <li>Obtain and keep warranties on repairs</li> <li>Keep record of each service to equipment</li> <li>Check cylinder weight regularly etc.</li> </ol> </li> <li>Refer to appropriate standards.</li> </ul> | ✓  |                                |                                     |
|   | Infrequent testing of equipment containing refrigerant  | <ul style="list-style-type: none"> <li>Check that all test equipment is in good working condition at least once every three months. Test leak detectors and recovery units</li> <li>Regularly monitor vacuum pump oil etc.</li> <li>Ensure quarterly equipment maintenance records are kept up to date.</li> </ul>   | ✓  |                                |                                     |
|   | Inadequate leak testing   | <ul style="list-style-type: none"> <li>Implement best practice procedure as per Standard and/or code of practice</li> <li>Check at least every three months</li> <li>Ensure quarterly cylinder leak test &amp; in-test expiry date records are kept up to date.</li> </ul>   | ✓  |                                |                                     |

## Risk Management Plan (continued)

| Activity steps                        | Potential hazards/risks   | Risk control measures   | Standards and Code of practice reference | Person responsible (full name) | Next review date (within 12 months) |
|---------------------------------------|---|---|--|--------------------------------|-------------------------------------|
| Recovery and recycling of refrigerant | Improper filling of cylinders                                   | <ul style="list-style-type: none"> <li>Fill bulk refrigerant cylinders in-line with manufacturers' recommendations etc.</li> </ul>  | ✓  |                                |                                     |
| Decommission end of life equipment    | Poor cleaning and flushing                                      | <ul style="list-style-type: none"> <li>Never charge refrigerant into equipment with identified leaks</li> <li>Refer to standards and Code of Practice for leak testing procedures.</li> </ul>   | ✓  |                                |                                     |
|                                       | Venting   | <ul style="list-style-type: none"> <li>Never vent fluorocarbon refrigerant where its release is avoidable etc.</li> </ul>   | ✓  |                                |                                     |
|                                       | Leakage of refrigerant if pumped down and left in the equipment | <ul style="list-style-type: none"> <li>All refrigerant is to be reclaimed from all parts of the system at the time of decommissioning</li> <li>After recovery refrigerant is to be recycled or returned to an authorized refrigerant supplier (see 'Disposal').</li> </ul>  | ✓  |                                |                                     |
| Storage of refrigerant                | Poor storage of cylinders on premises                           | <ul style="list-style-type: none"> <li>Ensure all cylinders are stored in a safe and secure location:                             <ol style="list-style-type: none"> <li>climate controlled (cool place, removed from direct sources of heat and the risk of fire)</li> <li>free of obstacles</li> <li>with appropriate signage to provide ready identification for emergency teams.</li> </ol> </li> </ul> | ✓  |                                |                                     |
| Disposal                              | Inadequate seals  | <ul style="list-style-type: none"> <li>Closed valves when not in use</li> <li>Check all seals for leakage every 3 months.</li> </ul>  | ✓  |                                |                                     |
|                                       | Mixing refrigerant types  | <ul style="list-style-type: none"> <li>Clearly identify refrigerant stored in cylinders</li> <li>Store reclaimed refrigerant separately.</li> </ul>   | ✓  |                                |                                     |

## **ABSTRACT**

This document outlines the results of the Market Acceptance Study (MAS), which was conducted in Egypt during the 2023 physical year as part of the HCFC PHASE-OUT Management Plan Stage II (HPMP II) activities.

The MAS was conducted to understand consumer perspectives on residential air conditioning products that contribute to reducing climate change and ozone depletion.

The report covers various topics related to the MAS, including its Background, Summary, Objectives, Methodology, Data Collection Tools, Sample Size Formula, Sample Classifications, Results, Findings, and Conclusion.

The findings of the MAS provide valuable insights into the preferences and perceptions of consumers in the Egyptian market regarding eco-friendly ACs. Manufacturers, suppliers, and policymakers can leverage these findings to develop effective marketing strategies, prioritize key attributes, and meet consumer demand for energy-efficient and cost-effective AC solutions.

## **Acknowledgment**

We would like to express our gratitude to Dr. Fukuya Iino, the HPMP II Project Manager, for providing support and facilitating all the necessary logistics to accomplish the study objective. Furthermore, we extend our appreciation to Dr. Ezzat Lewis, the NOU director, for giving effective guidance and valuable insights. Finally, we want to express gratitude to the project team and NOU team for their contributions throughout the various phases of the study.

## **BACKGROUND**

The HPMP II conducted a Market Acceptance Study to analyze the satisfaction levels of end-users and key distributors with current air conditioning (AC) product lineups, energy and environment-related information, and prices in the Egyptian market.

The MAS was conducted to understand consumer perspectives on residential air conditioning products that contribute to reducing climate change and ozone depletion.

## **SUMMARY**

The study focused on the pre-production phase of ACs that uses R32. The sample consisted of 402 participants who owned residential AC units across Cairo, Alexandria, Delta, Suez Canal, and Upper Egypt, proportionate to the population of each governorate.

The Market Acceptance Study was a two-stage survey that aimed to understand consumer perspectives on AC products that contribute to reducing climate change and ozone depletion.

The first stage involved administering an online questionnaire to end-users to assess their level of awareness and knowledge about eco-friendly ACs, the features that are most important to consumers when selecting a residential AC, the willingness of respondents to pay for eco-friendly specifications and energy efficiency, and the level of satisfaction with existing AC products available in the Egyptian market.

The second stage entailed conducting in-depth interviews with AC distributors in Egypt to assess their level of knowledge regarding eco-friendly ACs, understand the key features and characteristics of eco-friendly ACs, determine the potential price increase associated with eco-friendly specifications and energy efficiency, and formulate effective marketing strategies to introduce the concept of eco-friendly ACs to the Egyptian market.

The study findings shed light on the participants' perception of eco-friendly AC, with the majority associating them with energy and electricity savings.

When it comes to essential attributes of an air conditioning system, participants ranked after-sale service as the most significant, followed closely by high performance. While some respondents also considered eco-friendly technologies and affordability important, these attributes were not as highly valued.

The study found that participants were significantly interested in the concept of eco-friendly air conditioning and willing to pay more for it. Specifically, they expressed a willingness to pay a 5% premium to obtain eco-friendly features.

Additionally, the study identified digital media as the preferred communication channel for promoting eco-friendly air conditioning units, emphasizing the importance of online platforms in reaching and engaging with consumers. Offering discounts on the price of air conditioning units was also identified as an effective incentive for encouraging adoption.

Lastly, respondents emphasized the importance of energy efficiency in air conditioning systems as a driving factor in their decision-making process, highlighting the desire for lower electricity bills.

These findings provide valuable insights into the preferences and perceptions of consumers in the Egyptian market regarding eco-friendly air conditioning units. Manufacturers, suppliers, and policymakers can leverage these insights to develop effective marketing strategies, prioritize key attributes, and meet consumer demand for energy-efficient and cost-effective air conditioning solutions.

## METHODOLOGY

The end-users quantitative survey was conducted through an online questionnaire that took 20 minutes length with a total sample of **402** respondents.

The sample consisted of **60%** males and **40%** females and there was a soft quota in the respondents' age ranges between **18 – 24** years, **25 – 40** years, and **41- 60** years.

The socio-economic class of the sample was 50% from the A and B classes and 50% from the C class and was calculated based on the education, occupation, and income of respondents. The survey was conducted in three successive phases.

The first phase was a pilot phase that was conducted on a small sample to make sure that all the survey questions were clear and understandable, ensuring that we reached our research objective from each question, with no errors in the survey.

The second phase was conducted in Cairo and Alexandria with the distribution of **44%** from Greater Cairo (Cairo and Giza) and **13%** from Alexandria.

The third phase was conducted on a sample of **22%** from Upper Egypt, **18%** from Delta cities, and **3%** from Suez Canal cities.

The distributors' qualitative survey was conducted through in-depth interviews with three computer assisted telephone interviews with the distributors' of ACs in Egypt.

The study applied a quality checks process throughout the survey different phases to ensure the quality of the respondents that they are all eligible with the survey criteria, and the quality of their responses to ensure that they have a clear understanding of the survey questions.

## DATA COLLECTION TOOLS

A comprehensive study was conducted on end-users, surveying a total of 402 consumers. The study used the reliable and accurate Sawtooth SSI tool for conducting online surveys. The survey collected responses on various parameters, providing a rich dataset for analysis. The collected data was then analyzed using the Statistical Package for the Social Sciences (SPSS), which provided deep insights and valuable trends and patterns.

The qualitative phase (distributors) was conducted through In-depth computer-assisted telephone interviews.

## SAMPLE SIZE FORMULA

Z score (also called a standard score) gives you an idea of how far from the mean a data point is. But more technically it's a measure of how many standard deviations below or above the population.

**Sample Size Formula  $(Z^2 \times P (1 - P) / E^2) \div (1 + ((Z^2 \times P (1 - P)) / E^2 N))$**

**N = AC Annual productions size = 1,500,000 units (estimated)**

**E = Margin of error (5%)**

**Z = Desired confidence level (1.96) = 95%**

**P = Standard deviation (0.5)**

**$(3.8416 \times 0.5 (0.5) / (0.05^2)) \div (1 + ((3.8416 \times 0.5 (0.5)) / 3.750))$  Total sample size = 385 participants**

## QUESTIONNAIRE STRUCTURE

The questionnaire has two flows and sequences based on the response to the first question:

- The first sequence is for respondents who purchased an eco-friendly AC; identified as **Yes Sample**
- The second sequence is for respondents who didn't purchase eco-friendly AC; and identified as **No Sample**

Below are the questions along with the objective of each question for the end-user survey.

|  |   |
|--|---|
| <p>1) Did you purchase Eco-friendly air conditioning before?</p> <p><input type="checkbox"/> Yes                      <input type="checkbox"/> No</p>  | <p>Measure the awareness, knowledge, and interest of the respondents in their willingness to buy Eco-friendly air-conditioning</p>  |
| <p>2) Concerning the current ACs of the Egyptian Market, Assess your satisfaction level towards them on the level of energy efficiency</p> <p><input type="checkbox"/> Extremely satisfied    <input type="checkbox"/> Satisfied    <input type="checkbox"/> Neutral</p> <p><input type="checkbox"/> Unsatisfied                      <input type="checkbox"/> Extremely unsatisfied</p>   | <p>Assess the level of satisfaction with the current ACs (Energy efficiency &amp; Price) in the Egyptian Market</p>   |
| <p>3) What is your definition when you hear that this product is "Eco-friendly"?</p> <p><input type="checkbox"/> .....</p>   |   |
| <p>4) What are the features that make you say that the air conditioner is "Eco-friendly"? (From most important to least important)</p> <p><input type="checkbox"/> Energy efficiency                      <input type="checkbox"/> Reduces Carbon Emissions</p> <p><input type="checkbox"/> Air purification feature                      <input type="checkbox"/> Customized AC Systems</p>   | <p>Understand the level of awareness and interest of the respondents in environment related features in air conditioners use (R32)</p>  |
| <p>5) Does the idea of eco-friendly air conditioning motivate you to buy it?</p>   | <p><input type="checkbox"/> Yes                      <input type="checkbox"/> No</p>  |
| <p>6) Did you know that air conditioning that works with Freon (R32) is eco-friendly that helps combat climate change (reducing global warming), and is more efficient in consuming electricity?</p>   | <p><input type="checkbox"/> Yes                      <input type="checkbox"/> No</p>  |
| <p>7) Scale the important factors that important to you when you buy an AC?</p> <p><input type="checkbox"/> High performance                      <input type="checkbox"/> Affordability</p> <p><input type="checkbox"/> Eco-friendly technologies                      <input type="checkbox"/> Brand credibility</p> <p><input type="checkbox"/> After sale service                      <input type="checkbox"/> Shape &amp; Design</p> | <p>Identify the respondents' priorities in selecting residential AC</p> <ul style="list-style-type: none"> <li>Extremely Important</li> <li>Important</li> <li>Neutral</li> <li>Unimportant</li> <li>Extremely unimportant</li> </ul> |
| <p>8) What is the feature that you wish/would like to have, that is not available in your current AC?</p>  | <p>Gather info on respondents' potential wishes in ACs.</p>   |
| <p>9) Are you willing to pay for an Eco-Friendly AC that offers less electric bill due to better Energy efficiency, Lower energy consumption, saving environmental &amp; reducing global warming?</p>  | <p>Finding out the acceptable price increase percentage that respondents are willing to pay for Eco-friendly AC.</p> <ul style="list-style-type: none"> <li>5%</li> <li>10%</li> <li>15%</li> <li>More than 15%</li> </ul>            |
| <p>10) To what extent are you willing to pay an extra amount in the price of the air conditioner to obtain higher technical and environmentally friendly specifications?</p>   | <ul style="list-style-type: none"> <li>5%</li> <li>10%</li> <li>15%</li> <li>More than 15%</li> </ul>   |

**Finding out the acceptable price increase percentage that respondents are willing to pay for Eco-friendly AC.RESULTS AND OUTPUTS (END-USERS)**

The survey was conducted with the participation of 402 individuals. 182 respondents confirmed that they had purchased eco-friendly air-conditioners (ACs) and were referred to as the "Yes Sample". The remaining 220 individuals who did not buy eco-friendly ACs were referred to as the "No Sample".

The survey aimed to measure the respondents' awareness, knowledge, interest, and willingness to buy eco-friendly air-conditioning. The statistical analysis showed that out of the total sample of respondents, 45% had already purchased eco-friendly ACs, while 55% had not bought eco-friendly ACs.

Did you purchase Eco-friendly air conditioning before?

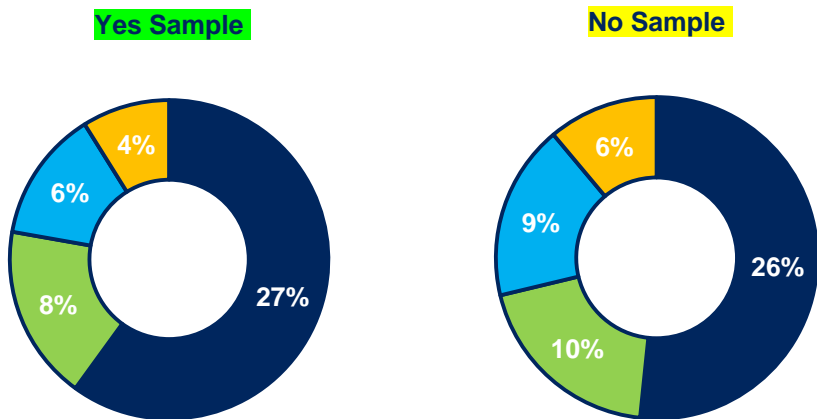

As for the assessment of the satisfaction level with the current ACs products in the Egyptian Market. The statistical analysis of the sample shows that 48% of the Yes Sample and 45% of the No Sample was satisfied with the ACs in the Egyptian Market.

Assess the level of satisfaction with the current ACs (Energy efficiency and Price) in the Egyptian Market

Concerning the definition of the **Eco-friendly**, the statistical analysis of the sample shows that **27%** from **Yes Sample** define Eco-Friendly as it saves electricity, **8%** define it as a protects the environment, **6%** doesn't define it as emit harmful gases or emissions into the air, and **4%** define it as purifies the air.

While **26%** of the **No Sample** define Eco-Friendly as it saves electricity, **10%** define it as it reduces air pollution, **9%** as it purifies the air, and **6%** as it doesn't emit harmful gases or emissions into the air.

What is your definition when you hear that this product is "Eco-friendly"?

The statistical description below shows that respondents of **Yes Sample** and **No Sample** ranked the following attributes from most important to the least important Energy Efficiency comes first, followed by Reducing Carbon Emissions, then Air Purification Feature, and lastly the Customized AC Systems that suit the consumer habits.

What is your definition when you hear that this product is "Eco-friendly"?

The survey also revealed that **97%** of the **Yes Sample** are motivated by the idea of the eco-friendly AC while **3%** are not motivated by the idea. While **88%** from the **No Sample** are motivated and **12%** are not motivated by the idea of Eco-friendly ACs.

Does the idea of eco-friendly air conditioning motivate you to buy it?

According to the statistical analysis of the sample, **69%** of the respondents who answered **"Yes"** were aware that using AC with R32 can help combat climate change and reduce global warming while being more efficient in consuming electricity, while **31%** were not aware of this.

In contrast, only **41%** of the respondents who answered **"No"** knew about the eco-friendly benefits of AC with R32, while **59%** did not know.

According to the statistical analysis of the **Yes Sample**, the factors that most influence the decisions of AC consumers are "After Sale Service" (73%), "High Performance" (69%), "Eco-friendly Technologies" (58%), and "Brand Credibility" (52%). These factors were rated as "Extremely Important" by the majority of respondents.

While, the respondents of **No Sample** rated 'After Sale Service' as the most important factor with an extremely high percentage of 71%, followed by 'High Performance' at 63%, 'Affordability' at 61%, and 'Brand Credibility' at 49%.

Regarding the identification of respondent preferences that are not currently available in the AC. The statistical analysis of the sample shows that 9% of the **Yes Sample** wish to have ACs that save electricity and power, followed by 4% that wish to have Air Purifying ACs, and 3% wish to have smart ACs that controlled by mobile app, while 21% of **No Sample** wish that ACs save electricity and power, followed by 5% that wish to have ACs that purify the air and 3% wish to have quiet ACs.

Respondents' wishes that is not available in the current ACs

The last part of the survey is designed to investigate the respondents' willingness to pay for an Eco-Friendly AC that offers Energy efficiency, lower energy consumption, saving the environment, and reducing global warming. The statistical analysis of the sample shows that 93% of the **Yes Sample** and 80% of the **No Sample** are willing to pay an extra amount for the Eco-Friendly AC offered specifications.

Willingness to pay an extra amount for Eco-Friendly AC specifications

The concluded statistics for the acceptable price increase percentage show that the mean of the acceptable price increase is 5% as per 43% of the **Yes Sample** and 55% of the **No Sample**.

The acceptable price increase percentage that respondents are willing to pay for Eco-friendly AC.

## RESULTS AND OUTPUTS (DISTRIBUTORS)

The qualitative phase comprised in-depth interviews with three AC distributors in Egypt. The questions and responses are presented below.

**Question One:** Amidst the current challenges, what opportunities exist in the air conditioning market?

There are various challenges faced by distributors in the air conditioning market such as short supply of all devices, suspension of imports, poor after-sale service, and scarcity of raw materials. Despite these challenges, there are still opportunities in the market such as improvements for after-sales service and the availability of air conditioners again.

**Question Two:** What are the factors that consumers usually consider when buying air conditioners?

The factors that consumers consider when buying air conditioners include 1) after-sale service, 2) competitive price, 3) material used, 4) brand name, 5) product quality, and 5) warranty.

**Question Three:** Suppliers were asked to rank the importance of various characteristics to consumers when purchasing an air conditioner?

They rated Price, Brand Credibility, and After-sale Service as Very Important. High Performance and Eco-friendly Technologies were rated as Important. Finally, the Shape and Design of the AC were rated as Neutral.

**Question Four:** What is the feature that the consumer wishes/ would like to have, that is not available in their current AC?

Suppliers have identified three main factors. Firstly, consumers want ACs that are energy-efficient to reduce electricity consumption. Secondly, they prefer ACs made with high-quality materials that are reasonably priced. Finally, there is a growing demand for smart ACs that can be controlled via Wi-Fi.

**Question Five:** Rank the characteristics that make you say that the air conditioner is "Eco-Friendly".

This is the ranking that suppliers gave to the eco-friendly characteristics of ACs: 1) Energy Efficiency, 2) Air Purification Feature, 3) Customized AC Systems, 4) Reduce Carbon Emissions

**Question Six:** How would you rate the idea of an eco-friendly air conditioning unit that offers better energy efficiency, lower energy consumption, and helps in saving the environment by reducing global warming while also providing a lower electricity bill?

AC distributors were presented with this new concept, and they all rated it as excellent.

**Question Seven:** What is your perceived average increase in price (as a percentage) that an air conditioner with higher technical and environmentally friendly specifications can be sold for?

Distributors have different opinions on the price increase for the new concept: 10%, more than 15%, and 50%.

**Question Eight:** How can this concept be marketed effectively to consumers to maximize its value for them?

According to the distributors, the best way to market this concept is through digital media platforms as they are the most common channels of communication with consumers. TV ads can also be used by communicating through the brand itself. Additionally, offering discounts and promotions that encourage consumers to buy the product is another effective way to market this concept.

## FINDINGS

Based on the study's findings and results, several key insights emerge:

- I. A significant majority of respondents (97% from the "yes" sample and 88% from the "no" sample) express motivation and interest in the new concept of eco-friendly ACs. This indicates a strong market potential and consumer receptiveness towards environmentally eco-friendly air conditioning solutions.
- II. The study reveals that a substantial proportion of respondents (93% from the "yes" sample and 80% from the "no" sample) are willing to pay an additional amount for eco-friendly ACs. This willingness to invest in eco-friendly features demonstrates a growing awareness and desire among consumers to prioritize sustainable and energy-efficient products.
- III. Among the respondents who express a willingness to pay more for eco-friendly ACs, the most commonly cited percentage increase in the price is 5%. This finding suggests that pricing strategies should consider this benchmark to align with consumer expectations and maximize market acceptance.
- IV. Digital media emerges as the preferred communication channel among consumers. Leveraging online platforms, such as social media, websites, and targeted digital advertising, will be effective in reaching and engaging with the target audience. Additionally, offering discounts or special promotions through these channels can further enhance the appeal and market acceptance of eco-friendly ACs.

These findings underscore the potential for successful market acceptance of eco-friendly ACs in the Egyptian market. By effectively promoting the energy-saving and environmentally conscious aspects of these ACs through digital outreach channels, and considering a reasonable price increase of around 5%, manufacturers and distributors can capitalize on the growing consumer demand for sustainable and energy-efficient air conditioning solutions.

## CONCLUSION

- 1) One of the key benefits of eco-friendly air conditioners is their ability to save electricity and operate with high energy efficiency, which is a top priority for consumers. The eco-friendly ACs are similar to inverter ACs but also contribute to environmental preservation. Energy efficiency is a significant attribute that resonates with consumers, and it should be emphasized when introducing the concept.
- 2) Providing robust after-sale service is crucial to ensuring customer satisfaction when purchasing ACs. Consumers consistently rate excellent after-sale service and optimal performance of the AC units as extremely important. Delivering both will enhance customer loyalty and satisfaction.
- 3) Consumers are willing to accept a modest increase of 5% in the price of ACs for eco-friendly specifications. This percentage aligns with the majority of respondents and can serve as a suitable benchmark for pricing strategies.
- 4) Digital media platforms are recommended as the primary communication channel to effectively convey the benefits of eco-friendly ACs and engage with consumers. These platforms offer extensive reach and enable targeted marketing campaigns. Emphasizing the energy-efficient nature of the ACs and implementing discounts or special offers can create a compelling value proposition for prospective buyers.

By incorporating these key points in marketing and business strategies, manufacturers and distributors can effectively promote eco-friendly ACs in the Egyptian market, addressing consumer demands and contributing to sustainable environmental practices.

## Acknowledgement

We would like to acknowledge the assistance given by the governmental sectors and the National Ozone Unit Officers of Egypt and Housing & Building National Research Center HBRC for their support in the implementation of the project and their assistance in facilitating communication with different stakeholders.

We also acknowledge the International Technical Review Team “EUROPEAN INDUSTRY ASSOCIATION Eurovent” that assist the project team in reviewing the process, results and report of the project.

Acknowledgement also goes to the “Egyptian Russian University ERU” for providing the testing yard, facilities (Electrical feeding, water supply ... etc.). In the same manner, Acknowledgement also goes to the “*Movenpick Soma Bay* Hurghada hotel” for providing the testing yard and the facilities (Electrical feeding, water supply, Wi-Fi network and so).

The project team also acknowledges the OEM manufacturers who built the IEC-H and DX system prototypes to be tested at the two definite locations.

- Delta Construction & Manufacturing DCM
- MISR Engineering Industries
- TIBA Engineering Industries Co.
- VOLTA EGYPT

Acknowledgement also goes to the OEM manufacturers who still actively working on building the IEC-H and DX system prototypes to be tested at the new expansion phase of the project.

- Egyptian German Air Treatment Company (EGAT)
- Misr Refrigeration & Air Conditioning MFG Co. (MIRACO)

## Project Team

This Project is contracted between the UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION "UNIDO" and Housing & Building National Research Center "HBRC". WHEREAS, UNIDO has been designated by the MULTILATERAL FUND FOR THE IMPLEMENTATION OF THE MONTREAL PROTOCOL as IMPLEMENTING AGENCY; and has agreed to provide assistance to the Egyptian Government in carrying out the project entitled "HCFC PHASE-OUT MANAGEMENT PLAN (HPMP) EGYPT (STAGE II)"

**The National Ozone Unit – Ministry of Environment, Egypt:** The ministry team provided guidance and direction and participated at project meetings and discussions. The project is funded by the HCFC Phase-out Management Plan (HPMP) of Egypt.

**The Project Management:** UNIDO and UN Environment provided overall management and coordination of the project, established the link with the technology providers, and oversaw the development of the report of the project. The Project was managed by **Mr. Ole Nielsen, Dr. Iino Fukuya**, Program Officer – UNIDO and **Eng. Ayman El-Talouny**, International Partnership Coordinator, Ozone Action Program – UN Environment

**The Coordination Consultant, Eng. Shahenaz Fouad and Eng. Ahmed El-Korashy** provided logistical support and coordination for the project.

**The Project general Manager and Technical Consultant and writer of the report, Dr. Alaa Olama** advised OEMs during prototype design and construction. Devised testing methodology and testing TOR, consulted with OEMs to provide technical solutions for problems as they arose wrote the report and provided analysis of data.

**HBRC** organized testing including testing results in both climatic zones, tabulated and created the excel sheets including figures, drawings and review and edit of the report

**The project personnel provided by the HBRC are as follows:**

| <b>Name</b>                       | <b>Project Function</b>                         |
|-----------------------------------|---|
| Prof. Sayed Shebl Mohamed         | Team Leader                                     |
| Eng. Sally Aladdin Ali            | Expert Testing Engineer                         |
| Eng. Aya Mohamed Zaki             | Expert Testing Engineer                         |
| Eng. Nourhan Abdel Rahman Mohamed | Expert Testing Engineer                         |
| Mr. Mohamed Shebl Mohamed         | Specialized Accountant Manager                  |
| Mr. Shady Gamal Abdel Aziz        | Specialized Awareness and Hospitality Assistant |
| Mr. Farid Rashed Ibrahim          | Specialized Testing Technician                  |
| Mr. Ahmed Maher Mohamed           | Specialized Testing Technician                  |
| Mr. Mostafa Abdullah Hamad        | Specialized Testing Technician                  |
| Mr. Ahmed Ezzat Mahmoud           | Specialized IT Assistant                        |
| Mss. Hebatallah Waheed Ismail     | Secretarial Work                                |
| Mr. Mohamed Hassan Ahmed          | Secretarial Work                                |
| Mr. Mohamed Ibrahim Abdel Moety   | Driver  |

**Executive Summary:**

This Project is contracted to provide assistance to the Egyptian Government in carrying out the project entitled “HCFC PHASE-OUT MANAGEMENT PLAN (HPMP) EGYPT (STAGE II)”

The project required each OEMs to individually manufacture a custom-built Indirect Evaporative Cooling Hybrid Air Conditioner (IEC-H) prototypes and a central DX unit to test and compare their performances under actual operating conditions in two of the eight climatic zones of Egypt.

The five figures below show the results of one OEM only in the two climatic zones tested. The figures below show the comparisons of the performance between the IEC-H unit and the DX unit over a 24 hours period. The tests results compared the values of the dry bulb temperatures out of the IEC-H and the DX units, the wet bulb temperatures, the EERs and the unit’s capacities. The tests were conducted for each OEM’s IEC-H and DX units simultaneously for a 24 hours period in two climatic zones.

Figure 3: Inlet ambient temperature versus outlet temperature of IEC Hybrid and DX units for OEM2 at CZ2

Fig 4: EER for IEC Hybrid unit & DX unit versus ambient relative humidity for OEM2 at CZ2

Fig 5: Cooling capacity for IEC Hybrid unit & DX unit versus ambient conditions for OEM2 at CZ2

Fig 6: Cooling capacity versus outlet wet bulb temperature for IEC Hybrid unit & DX unit for OEM2 at CZ2

Fig 7: Power consumption of DX unit and IEC Hybrid unit components for OEM2 at CZ2

All OEMs results (see Annex 1) showed better EER for their IEC-H units compared to their respective DX unit in the two climatic zones where the tests were conducted. The highest and lowest EERs of all OEMs are shown below in the two climatic zones.

In that sense, the report showed that an IEC-H system is superior thermodynamically to a DX system because it achieves higher EERs.

Fig 13: High and Low EER (in BTU/W.hr) for Climatic Zone 2

Fig 15: High and Low Capacity (in W) for Climatic Zone 5

Although the air discharge of both units for each OEM were the same, compressor capacity for each OEM varied considerably. OEMs used different capacity compressor in their IEC-H units compared to their respective DX unit tested. The tests showed that the capacity of the IEC-H unit when compared to the capacity of the respective DX unit also varied considerably. For a certain OEM, for some it was higher and for others inferior.

However, the report recommends further work to decide on the optimum size of compressor suitable for the IEC-H systems at all climatic zones assisted by further tests at the harshest climatic zone, CZ 8 to complete the tests needed for the writing of a code for Direct Indirect Evaporative Cooling.

The report breaks new ground for NIK air conditioning technologies and provides an alternative full fresh air system for air conditioning application that exceeds the efficiency of existing DX systems.

## Chapter 1

### 1. Results and Analysis of the Testing and Measurements for the Prototypes for all OEMs in Two Locations

#### 1.1. Selection of Climatic Zones 2 and 5

Figure 1: The Eight Climatic Zones of Egypt

|   |                             |   |                       |
|---|-----------------------------|---|-----------------------|
| 1 | North Coast Region          | 5 | Eastern Coast Region  |
| 2 | Delta and Cairo region      | 6 | High Heights Region   |
| 3 | North Upper Egypt Region    | 7 | Desert Region         |
| 4 | Southern Upper Egypt Region | 8 | South of Egypt Region |

Ambient temperatures in Egypt's are at their highest during June, July and August. This is why these months were targeted for the tests.

The tests were repeated in two climatic zones to show the effect of dry bulb temperature increase versus relative humidity decrease on the efficiency and capacity of the prototypes. Changes in these two parameters in two diverse zones, climatic zone 2 and climatic zone 5, would indicate the viability of an IEC-H system in lower humidity/higher ambient climates when compared to a DX system.

Figure 1 shows the different climatic zones of Egypt. Climatic zone 2 encompass the capital Cairo and its suburban cities across its latitude in the span west in the lower delta south of Alexandria's longitude and east across the Sinai Peninsula. Climatic zone 2 would be generally characterized

by its relatively higher humidity because it is in the lower delta with its extensive population clusters and its large agriculture fields. Tests in CZ 2 were performed at Badr city.

Climatic zone 5 is the eco-climatic zone around the shores of the red sea north from Suez to south in Halayeb and Shalatein and across south Sinai on the banks of the gulfs of Suez and Aqaba. Its dry bulb temperatures are moderate compared to further south in Egypt.

Climatic zone 5 is characterized by its higher dry bulb temperatures compared to CZ 2 and its lower humidity. Tests were performed in Hurghada city in CZ 5.

Comparison between the results in these two climatic zones would indicate the feasibility of the IEC-H system compared to a DX system as the dry bulb increases and the humidity decreases.

### 1.2. OEMs 1 and 5 did not Participate in the Tests

Although all manufacturers of central air-condition units in Egypt declared their intentions to participate in the project, in the end four out of six actively participated.

Two OEMs declined participation because of inability to allocate time or funds to manufacture IEC-H units. Both OEMs, though declared their intentions to participate in future projects in the same subject.

### 1.3. OEMs Active Participation in the Testing Program

Table 1: Testing in climatic zones 2 and 5

| <b>Status of Testing IEC Hybrid Prototypes and DX Units for all OEMs in August 2022</b> |                         |  |   |  |
|---|-------------------------|--|---|--|
| <b>OEM</b>  | <b>Both Units Ready</b> | <b>Climatic Zone 2 Testing Date in Badr City</b> | <b>Climatic Zone 5 Testing Date in Hurghada</b> | <b>Comments</b>                                      |
| <b>1</b>  | No                      | ---  | ---   | <i>Will not be ready this summer</i>                 |
| <b>2</b>  | Yes                     | 22- Aug  | 25- Aug   | <i>Finished testing in both CZ2 and CZ5</i>          |
| <b>3</b>  | Yes                     | 16- Jun  | 5- Jul  | <i>Finished testing in both CZ2 and CZ5</i>          |
| <b>4</b>  | Yes                     | 4- Aug   | 27- Aug   | <i>Finished testing in both CZ2 and CZ5</i>          |
| <b>5</b>  | Declined Participation  | ---  | ---   | <i>Declined testing – Needs technical assistance</i> |
| <b>6</b>  | Yes                     | 19- Jun  | 3- Jul  | <i>Finished testing in both CZ2 and CZ5</i>          |

Although all six OEMs manufacturing central air conditioning units in Egypt consented to participate in the testing program, only four OEMs tested their units in the two climatic Zones. Not all OEMs prototypes were ready for testing during these months. Table 1 shows the status of testing of the OEMs at the end of August 2022.

The reasons some OEMs could not participate in testing are elaborated on in 1.2.

### 1.4. Report no. 1, the Pre-Testing Phase

In report no. 1, the Pre-testing phase was reported and its results were listed. In this Pre-testing phase, the same criteria for testing were used, together with the same unit's arrangement. Please

refer to **annex 2** for the first report. The Pre-testing phase provided data and information on the problems associated with testing and also validated the selection of CZ 2 as a climatic zone with relatively higher humidity.

### **1.5. How the Tests were Performed?**

Each OEM tested two of his units in the same 24 hours, one IEC-H next to one DX unit.

Each OEM tested in the two designated climatic zones, 2 and 5.

Both units tested were full fresh air and had the same air flow rate.

Initially it was hoped the OEMs will use lower-GWP refrigerants approved to use in Egypt, R-32 and R-454 B. Unfortunately, this proved impossible because of the difficulties obtaining compressors for these refrigerants locally. To wait until compressors were sent from abroad, we would have missed the summer month's window and delayed the project a full year.

### **1.6. The Testing Methodology**

This is a brief description of the testing methodology. The complete testing methodology is shown in **annex 3**; the testing methodology follows EUROVENT recommendations.

- There were no intentions to compare the performance of OEMs units, one against the other. This is why OEMs are labelled by a confidential number and not by their original name.
- The purpose of the tests is to find out if there are energy efficiency advantages obtained by adopting a hybrid IEC system, IEC-H, when compared to a DX or chilled water system for the Egyptian climatic zones 2 and 5.
- Both units tested simultaneously were full fresh air units with rate of air discharge of one unit regulated so that it matches the other.
- To try to maintain 15 °C primary air outlet dry bulb temperature.
- For each OEM, testing was performed over a 24hr period for both units simultaneously.
- The tests performed for all OEMs, one after the other.
- The tests were considered completed once a 24 hours cycle is recorded for both IEC hybrid and DX units. If any of the units stopped working during the test, the test results were discarded.
- The tests meteorological readings were recorded.
- The tests were performed to obtain the total cooling capacities (watts) and the energy efficiency ratios (BTU/W.hr) of both IEC-H and the DX unit for each OEM simultaneously and compare the results over a 24 hours period; see the Egyptian standard EOS 3795:2013.
- In this report, the test values are plotted and analysed to help obtaining a definite understanding of the advantages of the systems at various climatic zones.
- An economic comparison is made by an economic expert to compare the Net Present Value (NPV) of the IEC-H to a DX unit over its lifetime to check its economic feasibility.
- The results of the economic study are now being calculated by the economic expert. The results of the economic analysis will be published when finished.
- Figure 2 shows the Schematic Diagram of the Test Arrangement with Instrumentation.

Fig 2: Schematic Diagram of the Test Arrangement with Instrumentation

## Chapter 2

### 2. Tabulation Formats for Compiling and Presenting the Results of the Project (Results in CZ2 and CZ5)

The results obtained were tabulated in excel sheets tabs as follows:

- Basic information
- Used apparatus for testing
- Abbreviations
- Final results listing
- Calculations of capacities and EERs for IEC-H
- Calculations of capacities and EERs for DX
- Graphs
- Units' arrangement drawing.

The tabs of the calculations of capacities and EERs for IEC-H units were used to plot the essential graphs in the tab graphs.

The figures show the following:

Figure 3: The ambient dry bulb temperature and the outlet dry bulb temperatures of the IEC-H and the DX units across a whole day

Figure 4: the EERs of both the IEC-H and the DX units and ambient RH across a whole day.

Figure 5: The cooling capacities of the IEC-H and DX unit and the ambient dry bulb temperature and RH across a whole day

Figure 6: The cooling capacities and the outlet wet bulb temperatures and RHs of the IEC-H and DX units across a whole day

Figure 7: The power consumptions of the DX unit and the IEC-H unit and its components.

This was repeated for each OEM in the two designated climatic zones, 2 and 5.

These figures were used in the analysis that follows each OEM.

All tabulated excel sheets are included in annexes 4 and 5.

## Chapter 3

### 3. Provision of the Technical Parameters for the Financial Model (Capital and Operating Costs of OEMs)

The financial analysis will provide us with figures that will help us decide if an IEC-H system is economically advantageous compared to a DX system.

In order to clarify how the economic study is made for all OEMs, a simplified example for OEM2 in CZ 2 is listed here. All figures used in this example are provided by the OEM2 or from the tests conducted for the OEM2 in CZ 2.

#### OEM2 CZ2 - Basic Assumptions:

- **Investment Cost:**

| Unit Type        | DX unit | IEC Hybrid |
|------------------|---------|------------|
| Total Price, EGP | 355,000 | 385,000    |

- **Annualizing the test:**

Testing between the two units was conducted on August 22, 2022, and an EFLH (equivalent full load hours per year) is assumed to characterize the test results annually.

The annual operation is assumed based on EFLH of 50% of total annual working hours as illustrated in the following table:

|                                   |    |       |
|-----------------------------------|----|-------|
| <b>Months Operating</b>           |    | 12    |
| <b>Days Operating</b>             |    | 365   |
| <b>Yearly working hours</b>       | hr | 8,760 |
| <b>Equivalent Full Load Hours</b> | %  | 50%   |
| <b>EFLH per year</b>              | hr | 4,380 |

- **Cost of Operations:**

The main costs incurred for producing the required energy is illustrated as in below.

| Maximum Power Consumption        | W/hr   | Annual Electricity Consumption |
|----------------------------------|--------|--------------------------------|
| <b>IEC Hybrid Unit</b>           | 8,607  | 37,698,660                     |
| <b>DX Unit</b>                   | 10,802 | 47,314,512                     |
| <b>Average Cost</b>              | kW/hr  | 1.60 (EGP)                     |
| <b>Electricity cost Increase</b> | %      | 0.00%                          |
| <b>Electricity Cost</b>          |        |                                |
| <b>IEC Hybrid Unit</b>           | EGP    | 60,318                         |
| <b>DX Unit</b>                   | EGP    | 75,703                         |
| <b>Difference -Saving</b>        | EGP    | 15,385                         |

The main costs incurred for the required water is illustrated as in below.

|                                     |             |                          |
|-------------------------------------|-------------|--------------------------|
| Maximum Water Consumption           | Litres/hour | Annual Water consumption |
| <b>IEC Hybrid Unit</b>              | 54          | 236,520                  |
| <b>DX Unit</b>                      | -           | -                        |
| <b>Average Cost per Cubic meter</b> |             | 5.00 (EGP)               |
| <b>water cost Increase</b>          | %           | 0.00%                    |
| <b>Water Cost</b>                   |             |                          |
| <b>IEC Hybrid Unit</b>              | EGP         | 1,183                    |
| <b>DX Unit</b>                      | EGP         | -                        |
| <b>Difference -Saving</b>           | EGP         | (1,183)                  |

▪ **Total Saving and Returns:**

The test showed a favorable difference for IEC Hybrid Unit, as it achieved total saving in its operation cost amount EGP 14,203 as illustrated in the following table:

|                           |         |
|---------------------------|---------|
| <b>Electricity Saving</b> | 15,385  |
| <b>Water Expenditure</b>  | (1,183) |
| <b>Net Saving</b>         | 14,203  |

The test showed a favorable difference for IEC-H unit, as it achieved total saving in its investment cost amount EGP 30k as illustrated in the following table:

|                           |             |
|---------------------------|-------------|
| <b>UNITS PRICES (EGP)</b> |             |
| <b>IEC Hybrid Unit</b>    | 385,000.00  |
| <b>DX Unit</b>            | 355,000.00  |
| <b>Difference -Costs</b>  | (30,000.00) |

The following table, the IEC Hybrid Unit shows favorable IRR of 46%, and NPV amount EGP 24,621 with a payback period of 3.11 years.

|                       |              |           |          |          |          |          |
|-----------------------|--------------|-----------|----------|----------|----------|----------|
|                       |              | Year (0)  | Year (1) | Year (2) | Year (3) | Year (4) |
| Net Cash              |              | (30,000)  | 14,203   | 14,203   | 14,203   | 14,203   |
| Cumulative Cash Flows |              | (30,000)  | (15,797) | (1,594)  | 12,608   | 26,811   |
| Discount Rate         |              | 20%       |          |          |          |          |
| NPV                   | <b>EGP</b>   | 24,620.57 |          |          |          |          |
| IRR                   | <b>%</b>     | 46%       |          |          |          |          |
| Breakeven Year        | <b>Years</b> | 3.00      |          |          |          |          |
| Fraction              | <b>Years</b> | 0.11      |          |          |          |          |

## Chapter 4

### 4. Analysis of Testing Results and Measurements for the Prototypes and DX Units.

The testing results and measurements for the prototypes and DX units provide us with figures that show us if an IEC-H system is technically advantageous compared to a DX system. The testing results and measurements for all OEMs are listed in details in Annex (1).

#### 4.1. OEM2, Climatic Zone 2

*Table 2: Basic Information for OEM2 at Climatic Zone 2*

| Basic Information   |                            |                           |  |
|---------------------|----------------------------|---------------------------|--|
| Tested Units Name   | DX                         |                           | Direct Expansion Unit                    |
|                     | IEC hybrid                 |                           | Indirect Evaporative Cooling Hybrid Unit |
| OEM No.             | 2                          |                           |  |
| Air Flow Rate       | 2000                       |                           | c.f.m for DX and IEC hybrid Units        |
| Water Bath Area     | 1000*900                   |                           | mm <sup>2</sup>                          |
| Climatic Zone       | 2 (Delta and Cairo Region) |                           |  |
|                     | Altitude                   | 208                       | meter (from sea level)                   |
|                     | Location                   | 30°08' 36" N 31°43' 06" E |  |
| Test Date           | 22-Aug-22                  |                           |  |
| Compressor Capacity | DX                         | 10 TR                     | 35.2 kW                                  |
|                     | IEC-H                      | 10 TR                     | 35.2 kW                                  |
|                     |                            | DX Unit                   | IEC Hybrid Unit                          |
| Compressor brand    | Copeland Scroll ZP         |                           | Copeland Scroll ZP                       |
| Refrigerant         | R410 A                     |                           | R410 A                                   |

The figures below show the following:

- Figure 3: The ambient dry bulb temperature and the outlet dry bulb temperatures of the IEC-H and the DX units across a whole day for OEM2 at CZ2.
- Figure 4: The EERs of both the IEC-H and the DX units and ambient RH across a whole day for OEM2 at CZ2.
- Figure 5: The cooling capacity of the IEC-H and DX unit and the ambient dry bulb temperature and RH across a whole day for OEM2 at CZ2.
- Figure 6: The cooling capacities and the outlet wet bulb temperatures and RHs of the IEC-H and DX units across a whole day for OEM2 at CZ2.
- Figure 7: The power consumptions of the DX unit and the IEC-H unit and its components for OEM2 at CZ2.

Fig 3: Inlet ambient temperature versus outlet temperature of IEC Hybrid and DX units for OEM2 at CZ2

Fig 4: EER for IEC Hybrid unit & DX unit versus ambient relative humidity for OEM2 at CZ2

Fig 5: Cooling capacity for IEC Hybrid unit & DX unit versus ambient conditions for OEM2 at CZ2

Fig 6: Cooling capacity versus outlet wet bulb temperature for IEC Hybrid unit & DX unit for OEM2 at CZ2

Fig 7: Power consumption of DX unit and IEC Hybrid unit components for OEM2 at CZ2

**Analysis of the results of OEM2 at CZ 2:**

Table 3: High and Low readings for OEM2 at Climatic Zone 2

| CZ2                 |                   |                           |                           |                        |                        |
|---------------------|-------------------|---------------------------|---------------------------|------------------------|------------------------|
| High and low, °C    |                   |                           |                           |                        |                        |
| T <sub>db amb</sub> | RH <sub>amb</sub> | T <sub>db out IEC-H</sub> | T <sub>wb out IEC-H</sub> | T <sub>db out DX</sub> | T <sub>wb out DX</sub> |
| 37.7                | 55.3 @ 22:00      | 14.2                      | 11.9                      | 12.8                   | 11.1                   |
| 24.9                | 29.0 @ 13:00      | 8.5                       | 7.2                       | 9.6                    | 8.9                    |

- **$T_{db\ out}$  Comparison:**
  - In figure 3, the outlet dry bulb temperatures of both units are close to each other.
  - The swing in  $T_{db\ out}$  of DX unit is from to 12.8 °C to 9.6 °C, 3.2 °C swing
  - The swing in  $T_{db\ out}$  of IEC-H unit is from to 14.2 °C to 8.5 °C, 5.7 °C swing
  - The daily  $T_{db\ amb}$  changes from 37.7 °C down to 24.9°C, a swing of 12.8 °C.
  - The changes of  $T_{db\ out}$  of IEC-H unit are consistent with the ambient dry bulb, as it goes up it increases and vice versa. The same applies for the DX unit.
  
- **EERs Comparison:**
  - In figure 4, the EERs of the IEC-H are consistly higher than these of the DX unit although both use the same compressor capacity.
  - The swing in the values of the EERs of both units is consistent with the relative humidity. As the RHs increases the EERs decreases and vice versa.
  
- **Capacities Comparison:**
  - In figure 5, the IEC-H capacities are higher than those of the DX unit consistently except in the period 12:00 to 17:00 and 18:00 to 20:00 pm due to the losses in hot gas bypass.
  - This is important to note considering that both systems are equipped with the same capacity compressors.
  
- **$T_{wb\ out}$  Comparison:**
  - In figure 6, the changes of  $T_{wb\ out}$  of IEC-H unit were more pronounced than those of the DX unit across the day. This is understandable because during the day when RH was low more evaporation was used to achieve cooling in the IEC-H unit.
  - In the night, when humidity increases lower evaporation occurred in the IEC-H unit resulting in lower  $T_{wb\ out}$  of the unit in comparison the  $T_{wb\ out}$  of DX unit.
  - The swing in RHs were between 29.0 % at 13:00 to 55.3 % at 22:00
  
- **Power Consumptions Comparison:**
  - In figure 7, the total power consumption of the DX unit was consistently higher than that of the IEC-H unit across the whole day.
  - The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

## 4.2. OEM2, Climatic Zone 5

Table 4: Basic Information for OEM2 at Climatic Zone

| Basic Information   |                          |                           |  |
|---------------------|--------------------------|---------------------------|--|
| Tested Units Name   | DX                       |                           | Direct Expansion Unit                    |
|                     | IEC hybrid               |                           | Indirect Evaporative Cooling Hybrid Unit |
| OEM No.             | 2                        |                           |  |
| Air Flow Rate       | 2000                     |                           | c.f.m for DX and IEC hybrid Units        |
| Water Bath Area     | 1000*900                 |                           | mm <sup>2</sup>                          |

**Analysis of the results of OEM2 at CZ5:**

Table 5: High and Low readings for OEM2 at Climatic Zone 5

| CZ5                 |                   |                           |                           |                        |                        |
|---------------------|-------------------|---------------------------|---------------------------|------------------------|------------------------|
| High and low, °C    |                   |                           |                           |                        |                        |
| T <sub>db amb</sub> | RH <sub>amb</sub> | T <sub>db out IEC-H</sub> | T <sub>wb out IEC-H</sub> | T <sub>db out DX</sub> | T <sub>wb out DX</sub> |
| 38.8                | 54 @ 3:00         | 13.8                      | 11.8                      | 14.7                   | 12.3                   |
| 29.5                | 29 @ 17:00        | 8                         | 6.6                       | 9.1                    | 7.5                    |

- **T<sub>db out</sub> Comparison:**
  - In figure 8, the outlet dry bulb temperatures of the DX unit are generally slightly higher than those of the IEC-H except in a few readings when they are almost equal.
  - The swing in outlet dry bulb temperature of the DX unit is from 14.7 °C to 9.1 °C, 5.6 °C swing
  - The swing in outlet dry bulb temperature of the IEC-H unit is from 13.8 °C to 8 °C, 5.8 °C swing
  - The daily ambient dry bulb temperature changes are from 38.8 °C down to 29.5°C, a swing of 9.3 °C.
  - The changes of outlet dry bulb temperature of the IEC-H unit are consistent with the ambient db. As it goes up it increases and vice versa. The same applies for the DX unit.
  
- **T<sub>wb out</sub> Temperature Comparison:**
  - In figure 11, the changes of outlet wet bulb temperature of the IEC-H unit were closer to those of the DX unit across the day, except between 14:00 and 23:30.
  - In the night, when humidity increases lower evaporation occurred in the IEC-H unit resulting in lower outlet wet bulb temperature out of the unit and therefore in comparison the outlet wet bulb temperature of the DX unit is higher.
  - Unusually high ambient RH occurs, 29.3 % at 17:00 to 54 % at 3:00
  
- **EERs Comparison:**
  - In figure 9, the EER of the IEC-H is consistently higher than that of the DX unit except at 2:30, 5:30 and 8:00 when they were almost equal. This fluctuation arose due to the voltage fluctuation between 350 to 375 volt. This is important to note although both use the same capacity compressor.
  - The swing in the values of the EER of both units is consistent with the relative humidity. As the RH increases the EERs decrease and vice versa.
  
- **Capacities Comparison:**
  - In figure 11, the IEC-H capacity is higher than that of the DX unit consistently except in the period 23:30, 2:30 and 5:00 when both are almost equal.
  - Again, this is important to note although both systems are equipped with the same capacity compressors.
  
- **Power Consumptions Comparison:**
  - In figure 12, the total power consumption of the DX unit was close to that of the IEC-H unit across the whole day. Nevertheless, the EERs of the IEC-H unit were higher than those of the DX unit.
  - This is because of the unusually high ambient RH with consistently high ambient RH which necessitated high compressor power use in the IEC-H unit.
  - The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

Table 6: Concluding remarks on the performance of OEM2 IEC-H unit and the DX unit in CZ2 and CZ5

| CZ2                 |                   |                           |                           |                        |                        | CZ5                 |                   |                           |                           |                        |                        |

| IEC-H               | DX                | IEC-H                     | DX                        | IEC-H                  | DX                     | IEC-H               | DX                | IEC-H                     | DX                        | IEC-H                  | DX                     |
| 18.2                | 15.6              | 42118.08                  | 42751.24                  | 18.5                   | 17.5                   | 52001.32            | 49622.73          | 8.9                       | 6.1                       | 21047.24               | 18311.86               |
| 8.9                 | 6.1               | 21047.24                  | 18311.86                  | 14.0                   | 12.7                   | 38978.72            | 36124.40          |                           |                           |                        |                        |

- The EER of the IEC-H in CZ2 was between and 18.2 and 8.9 and that of the DX unit was between 15.6 and 6.1
- The EER of the IEC-H in CZ5 was between 18.5 and 14 and that of the DX unit was between 17.5 and 12.7
- The capacity of the IEC-H in CZ2 was between and 42,118 W and 21,047 W and that of the DX unit was between 42,751 W and 18,311 W.
- The capacity of the IEC-H in CZ5 was between and 52,001 W and 38,978 W and that of the DX unit was between 49,623 W and 36,124 W.
- The smaller swing in ambient dry bulb temperature at CZ5 compared to CZ2 (38.8 °C to 29.5°C compared at CZ2, to 37.7 °C to 24.9 °C) together with unusually high relative humidity in CZ5 (29 % at 17:00 to 54 % at 3:00 at CZ5 compared to 29% at 17:00 and 55% at 3:00 at CZ2) made the IEC-H unit unable to use its full potential for evaporation cooling across the day.
- The total capacities delivered by both units in CZ5 were higher than these at CZ2 (42,118 W and 42,751 W in CZ2 compared to 52,001 W and 49,622 W in CZ5).
- The Relative Humidity fluctuation also affected the performance of the IEC-H unit in CZ5.

## Chapter 5

### 5. The Final Results Analysis with Conclusion and Recommendation for Future Work

#### 5.1. The Final Results Analysis

##### 5.1.1. EER HIGH and LOW - CZ2

Fig 13: High and Low EER (in BTU/W.hr) for Climatic Zone 2

##### 5.1.2. CAPACITY HIGH and LOW - CZ2

Fig 14: High and Low Cooling Capacity (in W) for Climatic Zone 2

### 5.1.3. EER HIGH and LOW - CZ5

Fig 15: High and Low EER (in BTU/W.hr) for Climatic Zone 5

### 5.1.4. CAPACITY HIGH and LOW - CZ5

Fig 16: High and Low Cooling Capacity (in W) for Climatic Zone 5

## 5.2. Conclusion

The analysis of the final results of all OEMs shows the following:

- All OEMs show EERs of the IEC-H units that are superior to corresponding DX units.
- The IEC-H unit compressor capacity compared to DX unit is as follows:

| OEM | IEC-H Compressor capacity compared to compressor capacity of DX unit | IEC-H unit capacity compared to DX capacity |
|-----|--|---|
| 4   | Larger by 20 %   | Almost equal unit capacities                |
| 2   | Equal in capacity  | Almost equal unit capacities                |
| 3   | Smaller by 60%   | Lower unit capacities                       |
| 6   | Smaller by 70 %  | Lower unit capacities                       |

- Capacities of IEC-H units varied between OEMs; some had almost equal capacities compared to DX units and others had lower capacities.
- There was no direct relationship indicating whether the capacity of the compressor of the IEC-H units had an impact on the capacity of the units and whether there was a critical capacity size defining this relationship. This is an important point that needs further investigation.
- Further tests are needed at the highest ambient dry bulb temperatures and the lowest humidity, climatic zone 8, to deduce the optimum compressor capacity for the systems at all climatic zones, thus optimizing the system through an algorithm that decides compressor capacity for all nominal sizes.
- The financial analysis will provide us with figures that will help us decide if an IEC-H system is economically advantageous compared to a DX system.
- In order to clarify how the economic study is made for all OEMs, a simplified example for OEM2 in CZ were listed. All figures used in this example are provided by the OEM2 or from the tests conducted for the OEM2 in CZ 2.
- For OEM 2 in CZ 2, the IEC Hybrid Unit shows a favorable IRR of 46%, and an NPV of LE 24,621 with a payback period of 3.11 years.
- It remains to be seen according to the results of the ongoing economic study whether the higher price of the IEC-H units justify its use for the remaining OEMs according to the return on investment calculated using the comparison of the NPVs of both systems.
- The project is successful from the point of view of the technical analysis side because of the superior EERs of the IEC-H units despite some smaller capacity compressors used. The capacities of the IEC-H units were not always larger than these of the DX units.

### 5.3. Recommendation for Future Work

- Defining the critical compressor capacity size that will deduce the optimal capacity of the unit is an important point that needs further investigation.
- Further testing at the highest dry-bulb ambient temperatures and lowest humidity climate zone 8, is needed to derive the optimal compressor capacity for systems in all climatic zones, thus optimizing the system through an algorithm that determines compressor capacity for all nominal sizes.
- However, further work is needed to decide the optimum capacity of compressor suitable for IEC-H systems at all climatic zones assisted by further tests at the harshest climatic zone, CZ 8 to complete the tests needed for the writing of a code for Direct Indirect Evaporative Cooling.
- Compiling a final matrix for defining the extrapolation rules for setting the final reference-testing conditions. This work is being done by EUROVENT.

- It is recommended that for future work the IEC-H prototypes use lower GWP refrigerants approved in Egypt (Promotion of Low-GWP Refrigerants for the Air Conditioning Industry in Egypt, UNEP/UNIDO 2021) refrigerants R-32 and R-454 B.

## Chapter (6)

### 6. Reporting on the Advocacy and Outreach Campaign

#### INTRODUCTION

Outreach marketing campaign helped in the enforcement of **Transformation of Commercial Air Conditioning Companies in EGYPT** by promoting and publishing the results of the technical study to stakeholders. The services in this outreach campaign are to be made available to all stakeholders. The outreach campaign was designed to be person to person meeting, but because of the pandemic in Egypt, it was decided to change it to virtual meeting which was held on 21<sup>st</sup> December 2022.

#### OUTREACH PLAN GOAL

Characteristics of a goal statement should follow the **SMART** principle:

**Specific - Measurable – Action Oriented - Realistic - Time and Resource Constrained**

The outreach marketing campaigns had been targeted as if it can result in the following:

- ✓ Build awareness of the HCFC Phase-out Management Plan (HPMP).
- ✓ Promote and enhance your HVAC field growth by transformation of commercial HVAC companies in Egypt.
- ✓ Generate leads of alternative refrigerants code and direct/indirect evaporative cooling code.
- ✓ Increase HVAC users' retention.
- ✓ Effect collaborations and partnerships.

The objective of the outreach campaign to benefit from the experience gain testing the IEC-H and DX units in two climatic zones in Egypt. The main discussions were of the results of the testing of IEC-H and DX units of all OEMs.

The exact structure of this campaign is flexible and defined based on the outcomes of the deliverables and it was adjusted according to the content of the framework.

We held conferences with different OEMs individually to discuss the results. (November 2022)

Holding the outreach campaign (December 2022)

#### TARGET STAKEHOLDERS ATTENDING THE OUTREACH CAMPAIGN

Provided in this section is the list of individuals/other entities having a role in the development and implementation of the Plan. The following are the stakeholder groups to receive targeted outreach:

---

1- The Ministry of Electricity

---

|   |
|---|
| 2- Specifications and Standards                           |
| 3- Municipalities   |
| 4- All OEMs that were included in the program             |
| 5- Local Government Agency Officials and Department Heads |
| 6- Public Sector HVAC Project Planners                    |
| 7- Local Chapters of Regional/National Associations       |
| 8- Local Environmental Organizations                      |
| 9- Local HVAC Organizations and Interest Groups           |
| 10- HVAC Companies  |
| 11- Developers and Banks                                  |
| 12- The General Public                                    |
| 13- Other   |

#### **Presentation Given at the outreach Campaign held on 21<sup>st</sup> December 2022**

The presentation is attached in **Annex (7)**

#### **Question raised after the presentation**

- I. Question posed by Dr. Hesham Safwat (the British University in Egypt, BUC):
  - a. He inquired about the electrical consumption and how it was compared with the tariff in Egypt?
  - b. He inquired about the water consumption, how was it calculated and whether it was taken into consideration when doing financial analysis?
  - c. He asked when the IEC-H specification code will be ready to be used by consulting engineers?
- II. Question posed by Eng. Ahmed Magdy (the head of R&D in MIRACO)
  - a. He inquired how the capital cost used in the financial analysis was calculated?
  - b. He also inquired if the maintenance of the IEC-H units were calculated and included in the financial analysis, because of the higher costs of maintaining evaporation pads?
- III. Question posed by Eng. Hossam Abdelkader (Representing DCM company)
  - a. He inquired if there a plan to produce a code then legislate the usage of IEC-H for the different eight climatic zones of Egypt?
  - b. He inquired why SEER (Seasonal Electric Efficiency Ratio) was not calculated in the results?
- IV. Comment posed by Dr. Ezzat Lewis (the head of the Egyptian NOU)
  - a. Dr. Ezzat inquired about the SEER and alluded to a program by the green fund to work on the SEER in Egypt.

Prof. Sayed Shebl and Prof. Alaa Olama answered all the posed questions.

## Chapter (7)

### 7. Review and recommendation on how to update the national institutional technical documents of the new technologies

- I. There are no Egyptian codes for evaporation cooling.
- II. In view of the high response of the outreach campaign as the interest in determining specification on codes for this new technology by stakeholders, it is recommended to write a Direct-Indirect Evaporation Cooling code of practice
- III. The results obtained by this testing program have made it possible to recommend writing IEC code of practice for Egypt.

#### How to update:

##### Stage 1:

- 1- The results obtained by IEC-H in transformation of commercial air conditioning companies project proved that there is important benefit of the IEC technology compared to existing technology
- 2- Although the results obtained are suitable for climatic zone 2 and climatic zone 5, more results are needed to complete the data required for other climatic zones in Egypt
- 3- Following the recommendation suggested by EUROVENT assessments of the results of the test campaign and compiling a final matrix for defining the extrapolation rules for setting the final reference-testing conditions.

##### Stage 2:

- 1- An empirical correlation that corrected the results in the different climatic zones will be target
- 2- Create guidelines that to put the basis of the Egyptian code of practice for IEC

##### Stage 3:

- 1- Create the Egyptian code of practice for IEC

##### Stage 4:

- 1- Enforcement program for the Egyptian code of practice for IEC

## Annex (1) Provision of the technical parameters for the financial model (capital and operating costs of OEMs)

### ▪ OEM3, Climatic zone 2

Table 7: Basic Information for OEM3 at Climatic Zone 2

| Basic Information            |                                       |                           |  |

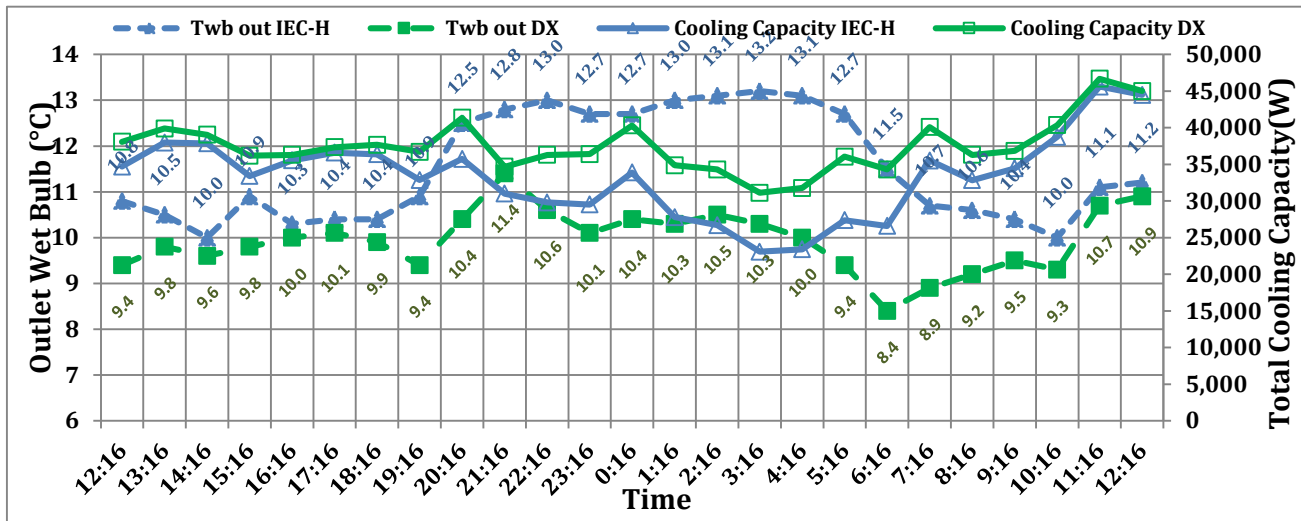

Fig 21: Power consumption of DX unit and IEC Hybrid unit components for OEM3 at CZ2

**Analysis of the results of OEM 3 at CZ 2:**

Table 8: High and Low readings for OEM3 at Climatic Zone 2

| CZ 2                |                   |                           |                           |                        |                        |
|---------------------|-------------------|---------------------------|---------------------------|------------------------|------------------------|
| High and low        |                   |                           |                           |                        |                        |
| T <sub>db amb</sub> | RH <sub>amb</sub> | T <sub>db out</sub> IEC-H | T <sub>wb out</sub> IEC-H | T <sub>db out</sub> DX | T <sub>wb out</sub> DX |
| 39.70               | 75.2 @ 5:16       | 14.90                     | 13.20                     | 12.60                  | 11.40                  |
| 23.40               | 27.0 @ 15:16      | 12.30                     | 10.00                     | 9.40                   | 8.40                   |

➤ **T<sub>db out</sub> comparison:**

- In figure 17, the outlet dry bulb temperatures of the IEC-H are higher than those of the DX unit.
- The swing in T<sub>db out</sub> of DX unit is from to 12.6 °C to 9.4 °C, 3.2 °C swing
- The swing in T<sub>db out</sub> of IEC-H unit is from to 14.9 °C to 12.3 °C, 2.6 °C swing
- The daily T<sub>db amb</sub> changes from 39.7 °C down to 23.4°C, a swing of 16.3 °C.
- The changes in T<sub>db out</sub> of IEC-H unit are affected by the change in T<sub>db amb</sub> and relative humidity.

- **T<sub>wb out</sub> comparison:**
  - In figure 20, the changes of T<sub>wb out</sub> of IEC-H unit were more pronounced than those of the DX unit across the day. This is understandable because during the day when RH was low more evaporation was used to achieve cooling in the IEC-H unit.
  - T<sub>wb out</sub> of IEC-H changes from 12.4 to 9.4
  - T<sub>wb out</sub> of DX changes from 11.4 to 8.4
  - In the night, when humidity increased lower evaporation occurred in the IEC-H unit resulting in lower T<sub>wb out</sub> of the unit in compared to T<sub>wb out</sub> of the DX unit.
  - The swing in RH was between 75.2 % at 5:16 to 27.0 % at 15:16
  
- **EERs comparison:**
  - In figure 18, the EERs of the IEC-H are consistently higher than that of the DX unit because of the IEC-H uses a smaller capacity compressor 17.6 kW (5 TR) compared to 45 kW (12.8 TR).
  - The swing in the values of the EER of IEC-H unit is consistent with the relative humidity. As the RHs increases the EER decreases and vice versa.
  
- **Capacities comparison:**
  - In figure 19, the IEC-H capacities are lower than those of the DX unit consistently.
  
- **Power consumptions comparison:**
  - In figure 21, the total power consumptions of the DX unit were consistently higher than those of the IEC-H unit across the whole day.
  - The compressor of the IEC-H unit constituted the largest portion of the power consumptions of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

▪ **OEM3, Climatic zone 5**

Table 9: Basic Information for OEM3 at Climatic Zone 5

| Basic Information                   |                                       |                           |  |

## Analysis of the results of OEM3 at CZ 5:

Table 10: High and Low readings for OEM3 at Climatic Zone 5

| CZ 5         |               |               |               |            |            |
|--------------|---------------|---------------|---------------|------------|------------|
| High and low |               |               |               |            |            |
| Tdb amb      | RHamb         | Tdb out IEC-H | Twb out IEC-H | Tdb out DX | Twb out DX |
| 37.40        | 46.20 @ 22:00 | 18.80         | 16.60         | 13.40      | 12.20      |
| 30.10        | 23.60 @ 10:00 | 12.10         | 9.70          | 7.10       | 5.70       |

### ➤ T<sub>db out</sub> comparison:

- In figure 22, the T<sub>db out</sub> of DX unit are higher than those of the IEC-H unit.
- The swing in T<sub>db out</sub> of DX unit is from to 13.4 °C to 7.1 °C, 6.3°C swing
- The swing in of T<sub>db out</sub> IEC-H unit is from to 18.8 °C to 12.1 °C, 6.7 °C swing
- The daily T<sub>db amb</sub> changes are from 37.4 °C down to 30.1°C, a swing of 7.3 °C.

### ➤ T<sub>wb out</sub> temperature comparison:

- In figure 25, the changes of T<sub>wb out</sub> of IEC-H unit were consistently higher than those of the DX unit across the day.
- In the night, when humidity increases lower evaporation occurred in the IEC-H unit resulting in higher T<sub>wb out</sub> of the unit.
- Ambient RH are nearer to their expected levels in this time of the year, at 23.6 % at 10:00 to 46.2 % at 22:00

### ➤ EERs comparison:

- In figure 23, the EERs of the IEC-H are consistly higher than those of the DX unit. This is important to note because its compressor's capacity is 17.5 kW (5 TR) compared to 45 kW (12.8 TR) for the DX unit.
- The swing in the values of the EER of both units is consistent with the relative humidity. As the RH increase the EERs decreases and vice versa.

### ➤ Capacities comparison:

- In figure 24, the DX unit capacities are consistently higher than those of the IEC-H unit.

### ➤ Power consumption comparison:

- In figure 26, the total power consumptions of the DX unit are much higher than that of the IEC-H unit across the whole day.
- The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

Table 11: Concluding remarks on the performance of OEM3 IEC-H unit and the DX unit in CZ2 and CZ5

| 15.7                | 10.5               | 23079.78                     | 31102.75                     | 13.6                      | 8.7                       | 20841.57            | 30486.34            |                              |                              |                           |                           |

- The EER of the IEC-H in CZ2 was between and 31.6 and 15.7 and that of the DX unit was between 13.7 and 10.5
- The EER of the IEC-H in CZ5 was between 20.8 and 13.6 and that of the DX unit was between 12.7 and 8.7
- The capacity of the IEC-H in CZ2 was between and 45,624 W and 23,080 W and that of the DX unit was between 46,676 W and 31,103 W.
- The capacity of the IEC-H in CZ5 was between and 34,018 W and 20,842 W and that of the DX unit was between 47,300 W and 30,486 W.

The smaller capacity compressor of the IEC-H units seems to be governing factor in understanding the results of the tests.

- EERs of the IEC- H diminish considerably in CZ5 with the higher humidity of CZ5.
- EERs of the DX unit diminish also but to a much lesser extent.
- The capacities of the IEC-H unit diminish considerably in CZ 5 at the higher humidity of CZ5.
- The capacities of the DX unit diminish also but to a much lesser extent.
- Generally, the capacities of the DX unit were higher than these of IEC-H unit.

**Analysis of the results of OEM 4 at CZ 5:**

Table 14: High and Low readings for OEM4 at Climatic Zone 5

| CZ 5         |              |               |               |            |            |
|--------------|--------------|---------------|---------------|------------|------------|
| High and low |              |               |               |            |            |
| Tdb amb      | RHamb        | Tdb out IEC-H | Twb out IEC-H | Tdb out DX | Twb out DX |
| 37.50        | 54.80 @ 3:00 | 16.20         | 14.60         | 16.30      | 14.10      |
| 28.40        | 29.00 @ 9:00 | 10.30         | 9.60          | 9.80       | 8.90       |

➤ **T<sub>db out</sub> comparison:**

- In figure 32, the T<sub>db out</sub> of DX unit are nearly similar to those of the IEC-H unit.
- The swing in T<sub>db out</sub> of DX unit is from to 16.3 °C to 9.8 °C, 6.5 °C swing
- The swing in of T<sub>db out</sub> IEC-H unit is from to 16.2 °C to 10.3 °C, 5.9 °C swing
- The daily T<sub>db amb</sub> changes are from 37.5 °C down to 28.4°C, a swing of 9.1 °C.
- The changes of T<sub>db out</sub> of IEC-H unit are consistent with the T<sub>db amb</sub>, as it goes up it increases and vice versa. The same applies for the DX unit.

➤ **T<sub>wb out</sub> Temperature comparison:**

- In figure 35, the T<sub>wb out</sub> of IEC-H unit and the DX unit were changing places as the higher ones across the day.
- In the night, when humidity increases lower evaporation occurred in the IEC-H unit resulting in lower T<sub>wb out</sub> of the unit.
- Ambient RH are nearer to their expected levels in this time of the year, at 29 % at 9:00 to 54.8 % at 3:00

➤ **EER comparison**

- In figure 33, the EERs of the IEC-H were consistly higher than those of the DX unit. This is important to note. The compressor’s capacity of the IEC-H unit is 50 kW (14 TR) compared to 42 kW (12 TR) for the DX unit, nominally 20% higher.

- The swing in the values of the EER of both units is consistent with the relative humidity. As the RH increase the EERs decreases and vice versa

➤ **Capacities comparison:**

- In figure 34, the IEC-H unit capacities are close to those of the DX unit.

➤ **Power consumptions comparison:**

- In figure 36, the total power consumptions of the DX unit are relatively higher than that of the IEC-H unit across the whole day.
- The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

Table 15: Concluding remarks on the performance of OEM4 IEC-H unit and the DX unit in CZ2 and CZ5

| CZ2                 |                     |                              |                              |                           |                           | CZ5                 |                    |                              |                              |                           |                           |

| N/A                 | N/A                 | N/A                          | N/A                          | N/A                       | N/A                       | 11.3                | 12.3               | 23425.01                     | 27718.04                     |                           |                           |

The compressor nominal capacity of the IEC-H unit is higher than that of the DX unit by about 20%. This is unusual; perhaps the special design of the IEC-H unit is the reason.

- T<sub>db out</sub> achieved by the IEC-H unit are almost equal to those of the DX unit.
- EERs of the IEC- H are also superior to those of the DX unit.
- The capacities of the IEC\_H unit are almost equal to these of the DX unit.
- The IEC-H unit performance, both capacity and EER, is remarkable although it uses a relatively larger compressor capacity.

▪ OEM6, Climatic zone 2

Table 16: Basic Information for OEM6 at Climatic Zone 2

| Basic Information   |                            |                           |  |

**Analysis of the results of OEM 6 at CZ 2:**

Table 17: High and Low readings for OEM6 at Climatic Zone 2

| CZ 2                |                   |                           |                           |                        |                        |
|---------------------|-------------------|---------------------------|---------------------------|------------------------|------------------------|
| High and low, °C    |                   |                           |                           |                        |                        |
| T <sub>db amb</sub> | RH <sub>amb</sub> | T <sub>db out</sub> IEC-H | T <sub>wb out</sub> IEC-H | T <sub>db out</sub> DX | T <sub>wb out</sub> DX |
| 34.10               | 52.5 @ 23:00      | 16.40                     | 15.70                     | 14.90                  | 13.60                  |
| 23.40               | 28.00 @ 13:00     | 12.90                     | 12.40                     | 9.60                   | 8.60                   |

- **T<sub>db out</sub> comparison:**
  - In figure 37, the T<sub>db out</sub> of the IEC-H unit are slightly higher than these of the DX unit.
  - The swing in T<sub>db out</sub> of DX unit is from to 14.9 °C to 9.6 °C, 5.3°C swing
  - The swing in of T<sub>db out</sub> IEC-H unit is from to 16.4 °C to 12.9 °C, 3.5 °C swing
  - The daily T<sub>db amb</sub> changes are from 34.1 °C down to 23.8°C, a swing of 10.3 °C.
  - The changes of T<sub>db out</sub> of IEC-H unit are consistent with the T<sub>db amb</sub>, as it goes up it increases and vice versa. The same applies for the DX unit.
  
- **T<sub>wb out</sub> temperature comparison:**
  - In figure 40, the changes of T<sub>wb out</sub> of IEC-H unit were higher than those of the DX unit
  - Ambient RH are nearer to their expected levels in this time of the year, at 28 % at 13:00 to 52.5 % at 23.00
  
- **EER comparison:**
  - In figure 38, the EERs of the IEC-H are much higher than these of the DX unit when the RH is low, 12:00 to 22:00 and 6:00 to 12:00. This is important to note.
  - The compressor’s capacity of the IEC-H unit is 12 kW (3.4TR) compared to 40 kW (11 TR) for the DX unit, nominally 3.4 times larger.

- The swing in the values of the EER of both units is consistent with the relative humidity. As the RH increase the EERs decreases and vice versa

➤ **Capacities comparison:**

- In figure 39, the DX unit capacities are consistently higher than these of IEC-H unit.
- This is probably because the DX unit compressor capacity is much larger than that of IEC-H unit.

➤ **Power consumptions comparison:**

- In figure 41, the total power consumptions of the DX unit are much higher than that of the IEC-H unit across the whole day. Note the larger capacity compressor of the DX unit.
- The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions

▪ **OEM6, Climate zone 5**

Table 18: Basic Information for OEM6 at Climatic Zone 5

| Basic Information   |                          |                           |  |
|---------------------|--------------------------|---------------------------|--|

**Analysis of the results of OEM6 at CZ5:**

Table 19: High and Low readings for OEM6 at Climatic Zone 5

| CZ5                 |                   |                           |                           |                        |                        |
|---------------------|-------------------|---------------------------|---------------------------|------------------------|------------------------|
| High and low, °C    |                   |                           |                           |                        |                        |
| T <sub>db amb</sub> | RH <sub>amb</sub> | T <sub>db out IEC-H</sub> | T <sub>wb out IEC-H</sub> | T <sub>db out DX</sub> | T <sub>wb out DX</sub> |
| 35.80               | 48.00 @ 19:00     | 17.10                     | 16.50                     | 17.40                  | 15.80                  |
| 27.50               | 27.00 @ 3:00      | 8.10                      | 7.70                      | 10.30                  | 8.40                   |

➤ **T<sub>db out</sub> comparison:**

- In figure 42, the T<sub>db out</sub> of DX unit are nearly similar to those of the IEC-H unit.
- The swing in T<sub>db out</sub> of DX unit is from to 17.4°C to 10.3 °C, 7.1 °C swing
- The swing in of T<sub>db out</sub> IEC-H unit is from to 17.1 °C to 8.1 °C, 9 °C swing
- The daily T<sub>db amb</sub> changes are from 35.8 °C down to 27.5°C, a swing of 8.3 °C.
- The changes of T<sub>db out</sub> of IEC-H unit are consistent with the T<sub>db amb</sub>, as it goes up it increases and vice versa. The same applies for the DX unit.

- **T<sub>wb out</sub> Temperature comparison:**
  - In figure 45, the changes of T<sub>wb out</sub> of IEC-H unit were higher than those of the DX unit except between 2:30 to 10:30.
  - Ambient RH are nearer to their expected levels in this time of the year, at 27 % at 3:00 to 48 % at 19:00
  
- **EER comparison:**
  - In figure 43, the EERs of the IEC-H are consistly higher than those of the DX unit, this is important to note the compressor’s capacity of the IEC-H unit is 12 kW (3.4 TR) compared to 40 kW (11 TR) for the DX unit.
  
- **Capacities comparison:**
  - In figure 44, the IEC-H unit capacities are lower than these of the DX unit except between 3:30 and 9:00.
  - This is important to note the compressor’s capacity of the IEC-H unit is 12 kW (3.4 TR) compared to 40 kW (11 TR) for the DX unit.
  
- **Power consumptions comparison:**
  - In figure 46, the total power consumptions of the DX unit are relatively much higher than that of the IEC-H unit across the whole day.
  - The compressor of the IEC-H unit constituted the largest portion of the power consumption of the unit while the evaporation fan, the supply fan and the pump constituted the remaining much lower consumptions.

Table 20: Concluding remarks on the performance of OEM6 IEC-H unit and the DX unit in CZ2 and CZ5

| 6.2                 | 5.6               | 8407.23                      | 18312.61                     | 12.9                      | 6.3                       | 19172.93            | 21016.48          |                              |                              |                           |                           |

The compressor nominal capacity of the DX unit is much larger than that of IEC-H unit, about 3.3 times larger. This is a bold design.

- T<sub>db out</sub> achieved by the IEC-H unit are nearly similar to the DX unit in CZ5 and slightly higher than in CZ2 except in one instance where they are almost equal.
- The EERs of the IEC-H unit are consistly higher than these of the DX unit in both CZs.
- Capacities performance in CZ5 is generally almost equal to that of the DX unit In CZ2 the capacity performance of the IEC-H unit is lower than that of the DX unit.
- The IEC-H unit performance, both capacity and EER is remarkable although it uses a much smaller compressor capacity.

## **Pre-Testing Technical Report**

### **The Project of the Transformation of Commercial Air Conditioning Companies (HCFC Phase-out Management Plan (HPMP) EGYPT (Stage II)), UNIDO ID: 140400**

#### **1. *Introduction:***

The project aims at providing technical assistance for the implementation of low GWP technology as well as examining the introduction of a Not-In-Kind technology, namely: Indirect Evaporative Cooling (IEC).

The project also proposes to look into the introduction of IEC in commercial air conditioning applications. The goal of the project is to secure phase out of HCFC in the commercial air conditioning manufacturing sector.

In September 2015, the world's nations agreed to adopt a set of 17 Sustainable Development Goals (SDGs). Egypt affirmed its commitment to meet the targets set by SDGs by 2030 and outlined a 15-year development strategy. The SDGs, spearheaded by the United Nations, include resilient, stable, and sustainable infrastructure as one of its goals, thus, the green building landscape is expected to soar in the upcoming years.

#### **2. *General Scope of Pre-tests***

Pre-test the hybrid IEC Unit simultaneously with the DX Unit to find out problems during pre-test process and evaluate results to be able to refine and finalize the testing methodology to send the results to UNIDO and EUROVENT.

During the pre-testing problems arose and we were able to overcome them through certain procedures that we recommend to follow during the actual testing undertaken next year.

### 3. *Egypt Climatic Zones & Field Testing*

The application of any new technology, in such larger capacities of commercial air-conditioning applications, requires setting the ground to allow market acceptability noting that these are not off-the-shelf products that industry can put in markets in large quantities. Commercial air-conditioning applications are commonly specified by consultants for projects ensure reliability of the product that can justify the initial investment. The project will invite an international organization with experience in guidelines and certification programs for HVAC applications including IEC systems to provide a reference testing methodology for the IEC-hybrid units suitable for Egypt’s working conditions. Egypt has 8 climatic zones out of which 7 climatic zones are suitable for IEC applications due to lower humidity conditions across the summer season, where the project is going to endorse and review the results and testing procedures during project implementation. Below figure show Egypt climatic zones:

|                                |
|--------------------------------|
| 1. North Coast Region          |
| 2. Delta and Cairo Region      |
| 3. North Upper Egypt Region    |
| 4. Southern Upper Egypt Region |
| 5. Eastern Coast Region        |
| 6. High Heights Region         |
| 7. Desert Region               |
| 8. South of Egypt Region       |

It is anticipated that the tests will be done in three locations, Cairo, Hurghada and Toshka (representing Zones 2, 5 and 8). The Location’s nearest Metrological Station are as per the following Table.

| <b>Weather Station Name</b> | <b>Weather Station Name Abbreviation</b> | <b>Weather Station Number</b> | <b>Latitude</b> | <b>Longitude</b> | <b>Altitude</b> |
|-----------------------------|--|-------------------------------|-----------------|------------------|-----------------|
| Cairo Airport               | HECA                                     | 623660                        | 30.13           | 31.4             | 64              |
| Hurghada                    | HEGN                                     | 624630                        | 27.15           | 33.71            | 16              |
| Toshka                      | HEBL                                     | 624190                        | 22.36           | 31.61            | 192             |

The data to be collected in the three locations are temperatures (dry and wet), relative humidity. The weather in Egypt is almost always sunny and no great changes in the weather conditions occur except the large temperature swing between night and day.

#### **4. *Prototypes and Testing Plan***

Through intensive round of discussion and consultation with local OEMs and based on formal communication and technical visits to their facilities to better understand capacities and readiness to build the needed prototypes.

##### **Progress of Prototype Building by Local OEM**

One OEM was ready with its prototype which was tested at their factory in 10th Ramadan City in Greater Cairo in Climatic Zone 2.

#### **5. *Pre-Testing Conditions***

The pre-testing was conducted at OEM “Zone 2: Delta and Cairo Region” at altitude of 344.5 Feet above sea level. Figure 1 describes the schematic diagram of the testing site.

- a. Both units were located at the entrance of OEM factory.
- b. The distance between the hybrid IEC Unit and DX Unit was about 3 meters long.
- c. The inlet of both units is directed to the North-East, and the outlet directed to the South-West.
- d. Both units are full fresh air units.

Figure (1) schematic diagram for both units

### 5.1 Description of Hybrid IEC Unit:

|                            |                |
|----------------------------|----------------|
| <b>Emerson Compressor</b>  | ECU2500        |
| <b>Airflow</b>             | 1940 cfm       |
| <b>Refrigerant type</b>    | R-32           |
| <b>Air</b>                 | Full fresh air |
| <b>Compressor capacity</b> | 55000 PTU/HR   |

### 5.2 Description of DX Unit:

|                            |                 |
|----------------------------|-----------------|
| <b>Emerson Compressor</b>  | PAS SU/SCX 1206 |
| <b>Airflow</b>             | 1940 cfm        |
| <b>Refrigerant type</b>    | R-410A          |
| <b>Air</b>                 | Full fresh air  |
| <b>Compressor capacity</b> | 154000 PTU/HR   |

*Note:* An inverter was connected to the motor of the air blower of the unit to adjust the air flow rate.

## 6. *Measuring Instruments Used in Pre-Testing*

| Code of Device | Instrument                 | Model      | Number of Devices | Measurement Scope                     |
|----------------|----------------------------|------------|-------------------|---------------------------------------|
| 1              | Temperature Humidity Meter | FLUKE 971  | 1                 | Temperature & Humidity                |
| 2&3            | Hygrothermometer           | KIMO TH300 | 2                 |                                       |
| 4&5            | Flow Meter                 | KIMO CP300 | 2                 | Air Flow                              |
| 6              | Power Analyzer             | KYORITSU   | 1                 | Power Consumption & Energy Efficiency |

*Note:* Catalogues of measuring devices are “**attached**”

## 7. *Testing Methodology*

Prototypes were tested in “OEM Factory” in which the EER and cooling capacities of both (Hybrid IEC & DX) Units are calculated from measurements of inlet and outlet wet and dry bulb temperatures and associated airflow rates, which measured as below:

- The pre-testing preparations included setting the Air flow for both the Hybrid IEC Unit and the DX Unit on the same value (1940 CFM) by using a measuring Flow Meters “**code 4&5**”.
- The pre-testing started at 1:00 PM on 6<sup>th</sup> October, 2021.
- The pre-testing steps included measuring the ambient conditions (Dry bulb temperature, and relative humidity), the performance of each unit by recording the outlet conditions (Dry bulb temperature, and relative humidity), in addition to the power consumption of both units.
- The recordings were taken hourly with a programmed data logging devices, and manually.
- The ambient temperature and relative humidity were measured by using measuring Temperature Humidity Meter instrument “**code 1**”.
- the temperature, relative humidity, wet bulb, and enthalpy of the Hybrid IEC Unit outlet, measuring by hygrothermometer instrument “**code 2**”.
- Similarly, hygrothermometer instrument “**code 3**” was used to record the temperature, relative humidity, wet bulb, and Enthalpy of the DX Unit.
- The power consumption was measured by using power analyzer “**code 6**”.
- Water consumption of the hybrid IEC unit is measured by monitoring the water level in the basins.

- Measurements are done automatically by programming the aforementioned devices to log data for duration of 24 hours with a sampling time of 1 hour.
- The logged data are then transferred to a PC for tabulation and analysis.
- The pre-testing ended at 3:00 PM, on 7<sup>th</sup> October, 2021.
- The pre-testing was paused between 3:00 AM to 7:00 AM on 7<sup>th</sup> October, 2021 in sync with the reduction of the ambient temperature below 20°C.

Figure 2 schematic diagram for the connection of the measuring devices on the site

## 7.1 Measuring Airflow Rate

- Airflow measuring apparatus (**code 4&5**) is subjected to the outlet of the two tested units in order to measure the airflow.
- The Air flow for both units is measured before starting the pre-test and is found about 1940 CFM for both units.

## 7.2 Measuring Wet and Dry Bulb Temperatures and Relative Humidity

- Air measuring devices for each unit (Inlet and Outlet) were used to measure average temperature.
- The Temperature Humidity Meter “**code 1**” is located in the inlet of the two tested units to measure both temperature and relative humidity.
- The two hygrothermometer instrument “**code 2&3**” are located in the outlet of the two tested units to measure both temperature and relative humidity.

### 7.3 Measuring Electrical Parameters:

- The Power Quality Analyzer “code 6” is used to measure electrical parameters such as power consumption, applied voltage, current consumption and power factor of both units.

### 7.4 Measuring Water consumption:

Water consumption of the hybrid IEC unit is measured by monitoring the water level in the basins.

- Water consumption was measured by calculating the decrease in the height of the water and multiplies it with the cross section area of the water bath:
  - ✓ Water bath (1) Dimensions (mm) =  $1728.5 \times 623$
  - ✓ Water bath (2) Dimensions (mm) =  $858.5 \times 920$

## 8. *Details of Performed Pre-tests*

Three pre-tests were conducted in order to construct a complete study for the performance of the hybrid IEC unit in comparison with the traditional DX unit:

The First Pre-test made by OEM, witnessed and assisted by HBRC: on 23<sup>th</sup> Sep.,2021.

### *Note:*

- After 8 hours of starting, the hybrid IEC unit stopped because of a technical failure.
  - The first pre-test did not finish due to the technical failure in the Hybrid IEC Unit, accordingly the data analysis was not completed.
  - The Measuring Data was included in “**Annex 1**”.
- a. The second Pre-test made by the OEM after the accuracy of the measuring instruments was checked by the TAB Company.

### *Note:*

- The calibration report, which checked by the TAB company is included in “**Annex 2**”.
  - Contact info. Of TAB Company: “The Engineering Company for Testing and Balancing Services”  
(Site: <https://www.tab.com.eg/>).
- b. The third Pre-test made by OEM, witnessed and assisted by HBRC: on 6<sup>th</sup> Oct., 2021  
“The testing report is included in the final results shown below”.

## 9. Final Results

|                            |  |
|----------------------------|--|
| • LAB                      | In Site  |
| • Company                  | OEM  |
| • Aims of Pre-Test :       | Comparison between the EER and Capacity of Hybrid IEC unit versus the DX Unit  |
| • Hybrid IEC Unit Model    | ECU2500  |
| • DX Unit Model            | PAS SU/SCX 1206  |
| • Description of Pre-Tests | <p>The first pre-test on 23<sup>th</sup> Sep.,2021 was discontinued after the hybrid IEC unit stopped.</p> <p>The second Pre-test was done to check the calibration of measuring instruments (3<sup>rd</sup> party TAB Company was invited to calibrate) on 28<sup>th</sup> Sep.,2021 .</p> <p>The final pre-test was the third on 6<sup>th</sup> Oct, 2021.</p> |
| • Airflow of Both Units    | 1940 cfm full fresh air  |
| • Altitude                 | 344.5 ft. above sea level  |
| • Duct size                | (28*12 inch)   |

---

### Remarks:

- Water consumption was measured by calculating the decrease in the height of the water column. The height was multiplied by the cross section area of the water bath:
  - a. Water bath (1) Dimensions (mm) =  $1728.5 \times 623$
  - b. Water bath (2) Dimensions (mm) =  $858.5 \times 920$
- Measurements started at 12:50 pm.
- Measurements were recorded hourly until 3 am, when both units stopped at inlet ambient temperature decreased below 20°C (Both hybrid IEC Unit and DX Unit were programmed to stop at 20°C).
- The measurements were restarted at 7 am next day (7<sup>th</sup> Oct., 2021) when the inlet ambient temperature exceeded 20°C.
- The pre-testing ended at 3 pm (7<sup>th</sup> Oct., 2021) after 24 records were achieved.

## Readings of DX Unit

*Table (1) Readings of DX Unit*

| DX Unit , Air flow = 1940 cfm , Altitude = 334.5 ft |          |          |           |           |                  |                      |                  |       |             |
|---|----------|----------|-----------|-----------|------------------|----------------------|------------------|-------|-------------|
| Hour  | Inlet DB | Inlet RH | Outlet DB | Outlet RH | Sensible Cooling | Latent dehumidifying | Cooling Capacity | Power | EER         |
|   | Celsius  | %        | Celsius   | %         | Btu/h            | Btu/h                | Btu/h            | kW    | Btu/hr.watt |
| 1PM   | 32.8     | 35.4     | 9.8       | 78        | 82,245           | 46,145               | 128,390          | 12.05 | 10.655      |

Figure (3): Cooling Capacity of (Hybrid IEC & DX) Units

Note: The Plotted Cooling capacity of both units in Btu/hr( $\times 10^3$ ).

**Figure (4): EER of (Hybrid IEC & DX) Units**

Figure (5): ambient (Relative humidity and Temperature) of (Hybrid IEC & DX) Units

## 10. Discussion of the results

- a. The capacity of the compressor of the hybrid IEC unit is smaller than the DX unit.
- b. Both units are full fresh air units with an inverter installed in the DX unit air blower to provide equality of the air flows.
- c. A testing and balancing third party were invited after the first test to make sure the measuring instruments were well calibrated.
- d. The hybrid IEC unit compressor was switched on continuously, as well as the DX unit compressor.
- e. The pre-testing started on 6<sup>th</sup> October, 2021 and ended on 7<sup>th</sup> October, 2021.
- f. In Figure 2:
  - As the ambient RH increases the capacity of the IEC unit decreases and vice versa.
  - The capacity of DX unit is almost constant.
  - As the dry bulb temperature increases the capacity of both units decreases and vice versa.
- g. In Figure 3:
  - The EER of the DX unit is almost constant during all the testing periods.
  - The EER of the hybrid IEC unit is superior that the DX unit throughout all relative humidities.
  - Although the RH increased from 29.6 to 72.9 (59.4 %) the EER of the hybrid IEC unit decreased from 18.49 to 15.822 (Percentage of improvement Hybrid IEC Unit=14.43%).
  - Percentage of improvement Hybrid IEC Unit= 34.0625%.
  - Percentage of improvement DX Unit = 25.2623%.
- h. According to table 1 and 2 we can sum up the following findings:

| Type | Min. RH % | Coincident T <sub>ab</sub> (Kelvin) | EER    | Cooling Capacity | Max. RH % | Coincident T <sub>ab</sub> (Kelvin) | EER    | Cooling Capacity | Diff. EER | Diff. Cooling Capacity |
|------|-----------|-------------------------------------|--------|------------------|-----------|-------------------------------------|--------|------------------|-----------|------------------------|
| DX   | 29.6      | 31.7                                | 8.716  | 107,122          | 72.9      | 20.7                                | 10.753 | 114,200          | 2.037     | 7,078                  |
| IEC  |           |                                     | 18.490 | 83,648           |           |                                     | 15.822 | 69,967           | 2.668     | 13,681                 |

## 11. Conclusions

- a. To make sure the testing comparison is more realistic between the hybrid IEC unit and DX unit; it is recommended that the size of compressors of both units have the same nominal capacity, or the dry bulb temperature of the outlet air for the hybrid IEC and DX unit are kept constant.
- b. Although the pre-testing was conducted at the end of the summer season, the results show the EER of the IEC unit is superior to that the DX unit.
- c. When testing at the height of the summer season the result is expected to be even better.
- d. Climatic Zone 2 “Delta and Cairo region” is relatively high in humidity, other climatic regions except climatic region 1 will show even better results because of the lower humidity.
- e. Consistent results for 24 hours took 3 days of pre-test trials.

### Notes:

- The EER is calculated using equation(1)

$$\text{EER} = \frac{\text{Total Cooling Capacity } \left(\frac{\text{Btu}}{\text{hr}}\right)}{\text{Power (watt)}} \quad (1)$$

- The Total Cooling Capacity is calculated using equation (2)

$$\text{Cooling Capacity (Btu/hr)} = \frac{\text{Enthalpy}_{in} - \text{Enthalpy}_{out}}{\text{flow} * \text{Air volume}_{@344.5 \text{ ft}}} \quad (2)$$

### Introduction

**⚠ Caution**

To extend sensor life, keep the sensor's protective shutter closed whenever the meter is not in use.

The Fluke Model 971 (hereafter referred to as "the Meter") is a battery powered meter that measures relative humidity and temperature. Through a few easy to use controls, the Meter displays three different temperature points of the air surrounding the meter's sensor: ambient, wet bulb, and dew point.

### Electrical and Safety Symbols

|--|--|
| <p style="text-align: center;"><b>Temperature Humidity Meter</b><br/>Operation</p> <p><b>Operation</b></p> <p style="text-align: center;"><i>Note</i></p> <p>When moving from one temperature/humidity extreme to another, allow time for the Meter to stabilize.</p> <p>After opening the sensor's protective shutter, press  to turn on the Meter and start taking measurements.</p> <p>Temperature readings are displayed in either the Celsius (°C) or Fahrenheit (°F) scale. To switch between °C and °F, remove the battery compartment door and position the temperature scale switch to the desired scale. See Figure 1.</p> <p><b>Dew Point and Wet Bulb Temperature</b></p> <p>The Meter displays ambient temperature when first turned on. To display dew point (DP) temperature, press  once. Press  again to switch to wet bulb (WB) temperature. Pressing  a third time returns the Meter to ambient temperature. The display indicates when dew point and wet bulb temperatures are selected.</p> <p><b>HOLD</b></p> <p>Pressing  causes the meter to freeze the displayed readings. It also causes the meter to stop taking measurements. <b>HOLD</b> is displayed when HOLD is enabled. To continue taking measurements, press  again.</p> <p style="text-align: right;">3</p>  | <p style="text-align: center;"><b>971</b><br/>Users Manual</p> <p><b>Min Max Record</b></p> <p>When enabled, Min Max Record stores a new measurement when it is either higher or lower than a previously stored maximum or minimum measurement. Press  to start Min Max Record. <b>MIN MAX</b> appears in the display to indicate Min Max Record mode is enabled.</p> <p style="text-align: center;"><i>Note</i></p> <p>The temperature scale switch (°C/°F), Save, Recall, and Hold buttons, as well as the Automatic Power Off (APO) switch are all disabled when Min Max Record is enabled.</p> <p>To view the stored Minimum, Maximum and Average readings, press  repeatedly to cycle through all three stored sets of measurements. You must select wet bulb, dew point, or ambient before reading their respective Min Max Avg values. The display indicates which stored set of readings is displayed. Pressing  a fourth time displays the present measurement.</p> <p>To exit Min Max Record mode and resume normal operation, press and hold  for two seconds.</p> <p><b>Saving and Recalling Measurements</b></p> <p>The Meter stores up to 99 readings for later recall. Each memory location stores relative humidity as well as ambient, dew point and wet bulb temperatures.</p> <p style="text-align: right;">4</p> |
| <p style="text-align: center;"><b>Temperature Humidity Meter</b><br/>Operation</p> <p>Pressing  saves the present readings to a memory location. <b>MEM</b> and the memory location number appear in the display to indicate the readings have been stored. Press  to return the display to the present reading. After all 99 memory locations are filled, each subsequent save overwrites a memory location starting with the first.</p> <p>To recall the readings from memory, press . If the memory location you are looking for is not already displayed, press  or  until the desired memory location is displayed. To return the Meter to normal operation, press  for two seconds.</p> <p>By default, relative humidity and ambient temperature are displayed when a memory location is recalled. Pressing  cycles through the Wet Bulb, Dew Point, and Ambient temperatures stored in the memory location displayed.</p> <p>To erase all 99 memory locations, simultaneously press  and  for five seconds.</p> <p><b>Automatic Power Off</b></p> <p>To save battery life, the Automatic Power Off (APO) feature can be used to turn the meter off after 20 minutes of no activity. To enable or disable the APO feature, remove the battery cover and position the APO switch to the desired position. See Figure 1.</p> <p style="text-align: right;">5</p> | <p style="text-align: center;"><b>971</b><br/>Users Manual</p> <p><b>Maintenance</b></p> <p><b>Battery Replacement</b></p> <p>Meter power is supplied by four 1.5 V (AAA size) batteries. When  appears in the display, replace the batteries as soon as possible. To replace the batteries:</p> <ol style="list-style-type: none"> <li>1. Back out the screw at the top of the battery door and lift the door away from the Meter.</li> <li>2. Remove the four AAA batteries from the compartment.</li> <li>3. Replace with four new AAA batteries, observing proper polarity as depicted on the bottom of the battery compartment.</li> <li>4. Replace the battery door and tighten the screw to lock it in place.</li> </ol> <p style="text-align: right;">6</p>  |

Figure 1. Battery Compartment

**Cleaning**

**⚠ Caution**

To avoid damage to the case, do NOT use abrasives or solvents for cleaning the meter.

Periodically wipe the case with Fluke Meter Cleaner or a damp cloth and detergent.

Specifications subject to change without notice

**LIMITED WARRANTY AND LIMITATION OF LIABILITY**

This Fluke product will be free from defects in material and workmanship for one year from the date of purchase. This warranty does not cover fuses, disposable batteries, or damage from accident, neglect, misuse, alteration, contamination, or abnormal conditions of operation or handling. Resellers are not authorized to extend any other warranty on Fluke's behalf. To obtain service during the warranty period, contact your nearest Fluke authorized service center to obtain return authorization information, then send the product to that Service Center with a description of the problem.

THIS WARRANTY IS YOUR ONLY REMEDY. NO OTHER WARRANTIES, SUCH AS FITNESS FOR A PARTICULAR PURPOSE, ARE EXPRESSED OR IMPLIED. FLUKE IS NOT LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES OR LOSSES, ARISING FROM ANY CAUSE OR THEORY. Since some states or countries do not allow the exclusion or limitation of an implied warranty or of incidental or consequential damages, this limitation of liability may not apply to you.

# Measuring Instruments - Code 4 & 5

### Technical Data Sheet

Pressure • Temperature • Humidity • Air Velocity • Airflow • Sound level

**New**

**CE**

## Pressure transmitter CP 300

**Range** from 0 Pa to 10 000 Pa (according to model)

**Resolution** resolution at 1 Pa on CP 300 (optional)

- Configurable intermediate and output zero ranges
- Air velocity and airflow functions (optional)
- Microbus network (optional)
- Microbus network (optional)
- External transmitter inputs (PICO Class 300 and 303 and Thermocouple K 2 inputs 4-20 mA or external 0-1 VDC, RS 232, 2-wire relay 0-2000 Vac)
- Push-button calibration (L2) and auto-zero (L3) (optional)
- Calibration function
- Microbus network RS 485 system (optional)
- ABS or ALU (P 485 housing, with or without digital display)
- Quick and easy recording using "10 bar" system with seal-mounting plate

**Transmitter features**

**Pressure**

**Measuring range** ... 300 "SP" values"

**Units of measurement** ... Pa, mbar (0.1 mbar), mmHg, mmHg (0.1 mmHg)

**Accuracy** ... ±0.5% of reading (1 Pa) for 300 (optional)

**Zero drift** ... 0.5% of reading (10 Pa) (P 300)

**Resolution** ... 1 Pa, 0.1 mbar, 0.1 mmHg, 0.1 mmHg

**Stabilization** ... push-button calibration (optional)

**Signal field** ... all and none (optional)

**Functions (optional)**

Class 300 transmitters can display up to 4 parameters simultaneously. The last 2 parameters are only displayed, they have no output.

**Housing features**

**Housing** ... ABS or ALU

**Fire-proof classification** ... ABS: V0 or UL94

**Protection** ... IP65

**Display** ... graphic screen 1 to 4 lines, 70 mm x 38 mm

**Fittings** ... stainless steel Ø 6.7 mm

**Connection gland** ... ALU: stainless steel with Ø 8 mm seal

**Weight** ... ABS: polyamide for cables Ø 7 mm max. ABS: 100 g - ALU: 130 g (with display)

**Part number**

Series and options brought to the part number

**Measuring range**

1 0-100 Pa  
2 0-1000 Pa  
3 0-10000 Pa

**Power supply / Output**

1 4-20 mA / 4-20 mA  
2 4-20 mA / 0-5 V  
3 4-20 mA / 0-5 V

**Display**

1 With display  
2 Without display

**Housing material**

1 ABS  
2 ALU

**Electrical connections**

1 4-wire (with seal-mounting plate)  
2 4-wire (with seal-mounting plate)

**SPV system features**

Interchangeable Pressure Sensor

The SPV board (Interchangeable Pressure Probe) includes a piezoresistive sensor element with its digital electronic system. This system is individually adjusted and records all the calibration parameters.

Via the automatic recognition by the transmitter, the digital board is totally interchangeable. Maintenance, service and calibration are easily performed on-site, without need for the process.

**Configurable intermediate and output zero ranges**

| Ref. of the probe | Pressure range   | Air velocity range |
|-------------------|------------------|--------------------|
| SPV 100           | 100-1000 Pa      | 2 to 15 m/s        |
| SPV 100           | 1000-10000 Pa    | 2 to 25 m/s        |
| SPV 1000          | 1000-10000 Pa    | 2 to 30 m/s        |
| SPV 10000         | 10 000-10 000 Pa | 2 to 100 m/s       |

**The minimum configurable range is 10% of the full range.**

**Overpressure tolerated** ... 25 000 Pa (CP 301, CP 302, CP 303)

**Response time** ... 0.1 s (CP 304)

**Type** ... digital

**Dimensions** ... 110 mm, 17.25 mm

**Working temperature** ... 0 to 100 °C

**Storage temperature** ... 0 to 110 °C

**Air velocity and airflow functions (optional)**

Pressure transmitters working with a differential probe (such as SPV300, Pico Max, or Pico 1) can be configured with a square root function. Via this function, and from the differential probe, the transmitter can calculate air velocity and airflow.

**Air velocity calculation function:**

$$C_v = \sqrt{C_p \cdot C_a \cdot C_v} \cdot C_{\text{pressure}} \cdot C_{\text{temp}}$$

**Integration of pressure measurement**

The pressure measurement element is very sensitive and reacts to pressure changes. When making measurements in unstable or movement conditions, the pressure measurement may fluctuate. The integration coefficient (from 0 to 9) enables an average of the measurements. The delay to reach any desirable value and parameters is stable measurement.

**Measurement and temperature compensation**

Temperature compensation can be made either manually by entering temperature value or automatically by a thermocouple (temperature probe optional). This probe can measure and display temperature, and can compensate air velocity for the (pressure) sensor.

**Type of transmitter** ... Thermocouple K (optional)

**Measuring range** ... 200 to +1300 °C (probe dependent)

**Units of measurement** ... °C, °F

**Resolution** ... 0.1 °C, 0.1 °F

**Technical Specifications**

**Power supply** ... 24 Vdc ± 10%, 50-60 Hz

**Output** ... 2 x 4-20 mA or 2 x 0-5 V (4 wire) maximum load: 1 K Ohm (0-5 V)

**Galvanic isolation** ... 500 Vdc and output per 100 Vdc (see marking code) (see 24 Vdc (optional))

**Consumption** ... 5 VA

**Relays** ... 2 relay (relay 0A / 230 Vac)

**Visual alarm** ... 2 red color LED (230 Vac)

**Audible alarm** ... 500 Hz

**Electrical compatibility** ... IEC 61010-1

**RS 485 communication** ... same terminal block for cables Ø 1.5 mm max. RS 485 communication ... digital Modbus RTU system communication speed configurable from 2400 to 115200 bauds

**RS 232 communication** ... digital RS 232C, emergency protocol

**Working temperature** ... 0 to 100 °C

**Storage temperature** ... 0 to 110 °C

**Environment** ... air and neutral gases

**Relays and Alarms**

Class 300 transmitters have 4 closed alarm and configurable alarms: 2 sound alarm (red color LED) and 2 relay (contacts).

**You can set:**

- 1 or 2 setpoints (high and low) configurable for each alarm
- the time delay (0 to 60 sec)
- the alarm action (stop/hold)
- the relay operation mode: position or register security
- the audible alarm (buzzer) activation.

**Self calibration**

Thanks to the temperature compensation of the probe (from 0 to 100 °C) and to the self calibration system, Class 300 transmitters guarantee an excellent long-term stability along with good measurement accuracy.

Self calibration procedure: the measurement value is electrically stored and compensated for any long-term drift of the sensitive element. Compensation is made by regular automatic calibration of the zero. The differential pressure measurement is four times as precise as the measurement of the transmitter.

**Electrical values (class)** ... 100 million cycles

**Relays** ... 230 Vac

**Self calibration frequency** ... can be disabled or set between 1 and 10 min

**Electrical connections - as per NFC15-100 Norm**

This connection must be made by a qualified technician. Without making the connection, the transmitter must not be energized.

**Power supply connection:**

Before making the connection, you must first check the power supply which is indicated on the transmitter head (see 4 on the connection diagram).

**For 24 Vdc power supply mode:**

**For 24 Vdc power supply mode:**

**For 115 or 230 Vdc power supply mode:**

**Output signal selection:**

Output signal selection voltage (0-5 V) or current (4-20 mA). The on-off switch located on the left leg of the transmitter (see 5 on connection diagram) allows selection of the required outputs.

**Output connection:**

4-wire output mode

0-5 V output: 0-5 V / 0 mA to 4-20 mA

4-20 mA output: 4-20 mA / 0 mA to 4-20 mA

**Connection of SMB-D15 RS 232 and RS 485 (Modbus):**

| Pin # | Description  |
|-------|--------------|
| 1     | NC           |
| 2     | NC           |
| 3     | NC           |

CAUTION! NC = DO NOT CONNECT

### Numerical communication

Support 2  
Cv: 5453 8487000

Tel: +1 (504) 233 14 14  
Fax: +1 (504) 233 12 12

mailto:info@sentronic.com  
www.sentronic.com

**RS 232 communication**

Via the RS 232 connection, the CP 300 can display 1 or 2 parameters that are measured by other Class 300 and 303 transmitters. In total: the CP 300 can display in addition to the pressure, other parameters such as temperature and humidity from a 1H-200 (for example).

Via the RS 232 connection, you can also configure your transmitter with the LC-300 software.

The RS 232 connection cable is available in 2m, 5m or 10m (maximum) lengths.

**Modbus network (RS 485 system)**

Class 300 transmitters can be linked to a bus network, an RS 485 system bus. They can also be integrated into an existing network.

When a Class 300 or 303 transmitter is connected to a CP 300 (with RS 232 connection), all the measurements can be given to the PLC/PCMS via the RS 485, with only one address for the 2 transmitters.

The RS 485 digital communication is a 2-wire network, on which the transmitters are connected in parallel. They are connected to a PLC/PCMS via the RTU Modbus communication system. Since the CP 300 can be configured with the keypad, the MICROBUS enables remote configuration, to measure 1 or 2 parameters or to see the status of the alarms.

**Configuration**

You can configure all the parameters of the transmitter: units, measuring ranges, alarm, output, channel, calculation formula... via the different methods shown below:

- Via keypad (optional) on models with display
- Via keypad (optional) on all models.
- Simple and easy keypad configuration. Use LC-300 user manual.
- Via MICROBUS (optional) on all models.
- Configuration of all parameters from your PC, via the supervision or data acquisition software.

**Configurable analogue outputs**

Configure the range according to your needs: outputs are automatically adjusted to the new measuring range.

Range with zero range (0-1000 Pa), with offset zero (2000-7000 Pa) or standard range (0-100 Pa): you can configure your own intermediate ranges according to your needs, between 10% and 100% of the full scale. The minimum configurable range is 10% of the full scale.

Quick manual

POWER QUALITY ANALYZER

**KEW 6310**

**KYORITSU ELECTRICAL INSTRUMENTS WORKS, LTD.**

Contents KEW6310

●Preface  
This Quick manual is a simplified version of the full instruction manual which can be found in the supplied CD-ROM. This manual is intended only as a handy reference guide and should only be used after having read the full instruction manual which contains full details on each function of this instrument and the items contained in the package.

●Safety Warning  
The instruction manual contains warnings and safety procedures which have to be observed to ensure safe operation of the instrument and maintain it in a safe condition. Thus, these operating instructions have to be read prior to using the instrument.

KEW6310 Instrument Overview

## 1. Instrument Overview

**Feature**  
This is a Clamp-type Power Quality Analyzer that can be used for various wiring systems. It can be used for simple measurements of instantaneous/ integration/ demand values, and also for monitoring waveforms and vectors, analyzing harmonics and measuring fluctuations in supply voltages and for the simulation of power factor correction with capacitor banks. Data can be saved either in the internal memory or a CF card, and can be transferred to a PC either via a USB lead or a CF Card reader.

- Safety construction**  
Designed to meet the international safety standard IEC 61010-1 CAT II 600V/ CAT III 1000V
- Wiring connection**  
KEW6310 supports: Single-phase 2-wire, Single-phase 3-wire, Three-phase 3-wire, Three-phase 4-wire.
- Measurement and calculation**  
KEW6310 measures voltage (RMS), current (RMS), and calculates active/reactive/apparent power, power factor, phase angle, frequency, neutral current and active/reactive/apparent electric energy (kWh).
- Demand measurement**  
Electricity consumption can be easily monitored so as not to exceed the target maximum demand values.
- Waveforms / Vector display**  
Voltage and current can be displayed by waveform or vector.
- Harmonic analysis**  
Harmonic components of voltage and current can be measured and analyzed.
- Power Quality (PQUAL)**  
Measuring Swell / Dip / Short Interruption, Inrush current, Unbalance ratio and flicker\*, moreover, simulating power factor correction with capacitor banks.  
\* Flicker measurement function is only available with ver 2.00 or later.
- Saving data**  
KEW6310 is endowed with a logging function with a preset recording interval. Data can be saved by manual operation or at a preset time & date. Screen data can be saved by using Print Screen function.
- Dual power supply system**  
KEW6310 operates either with an AC power supply or with batteries. Both dry-cell batteries (alkaline) and rechargeable batteries (NiMH) can be used. Battery charge while rechargeable batteries installed in the instrument is possible. In the event of interruption, while operating with AC power supply, power to the instrument is automatically restored by the batteries in the instrument.
- Large display**  
Color display with large screen
- USB & CompactFlash**  
Charge sensor type, compact and light weight design
- Application**  
Data in the internal memory or CF card can be saved in a PC via a USB lead or a CF Card reader. As well as the software facilitates setting, optional analysis software facilitates data analysis.
- Input/output function**  
Analogue signals from thermometers or light sensors can be measured simultaneously with electrical power data via 2 analogue inputs (DC voltage) signals exceeding a preset threshold values at each range can be transmitted to alarm devices via 1 digital output.

Functional Overview KEW6310

## Functional Overview

**Instantaneous value measurement**  
Measures average/max/min values of instantaneous values of current, voltage and electric power.

**Integration value measurement**  
Measures active/ apparent/ reactive powers on each CH.

**Demand measurement**  
Measures demand values based on the preset target values. Digital output signals alert the user that the predicted value may exceed the target value.

**SET UP**  
Setting of KEW6310 or of measurements.

Activate  
Go to Setting

KEW6310 Functional Overview

**Measurement at WAVE Range**  
Displays vector / waveform of voltages and currents per CH  
See (Section 8) WAVE Range for further details.

**Harmonic measurement**  
Measures / analyzes harmonic components of current & voltages  
See (Section 9) Harmonic Analysis for further details.

**Power quality analysis**  
Measures sags, dips, int. transient, inrush current, unbalance ratio and flicker, and also simulates power factor correction with capacitor banks.  
See (Section 10) Power Quality for further details.

\* Flicker measurement function is only available with ver.2.00 or later.

Instrument Layout KEW6310

### 2. Instrument Layout Front view

**Function Key**: Execute the displayed function.

**DISPLAY / SCREEN Key**: See the displayed screen as BMP files.

**ENABLED / LOCK Key**: Hide the readings. \* Measurement continues even if screen is frozen. Long press (2 sec or more) disables all keys to prevent operational error. Another long press (2 sec or more) is needed to restore the disabled keys.

**DISPLAY / LCD Key**: Display / hide the indications on the LCD.

**Cursor Key**: Select setting / switch screens.

**ENTER Key**: Confirms entries.

**ESC / RESET Key**: Cancel setting changes, clear integration / demand data with other keys.

**LED status indicator**: Light up recording / measuring / flash standby.

**Power Key**: Power ON / OFF.

**Home Key**: Measure waveforms, Measure integration values, Measure harmonic analysis, Measure demand values, Measure quality.

**W Key**: Measure waveforms.

**WH Key**: Measure integration values.

**QUALITY Key**: Measure quality.

**SET UP Key**: Set up.

KEW6310 Connector

### Connector

**Power Connector**

### Side face

When the Connector Cover is closed: CF Card Cover, USB Port, Analogue Input / Digital output.

When the Connector Cover is opened: Eject Button, CF Card Slot, Analogue Input / Digital output Terminal, USB Connector.

### Battery Case

\* Selector switch is under the Selector switch cover.

Getting Started KEW6310

### 3. Getting Started

The KEW6310 operates with either an AC power supply or batteries. In the event of AC power interruption, power to the instrument is automatically restored by the batteries in the instrument. Dry cell batteries (alkaline) and rechargeable ones (Ni-MH) can be both used. It is also possible to charge rechargeable batteries in the instrument.

Remove the Selector Switch Cover, and slide the Selector Switch to left or right depending on the batteries to be used.

| Battery can be used         | DRY-CELL BATTERY                 | RECHARGEABLE BATTERY                  |
|-----------------------------|----------------------------------|---------------------------------------|
|                             | Alkaline dry-cell battery (LR6)  | Ni-MH Rechargeable battery (HR-15/21) |
| Position of Selector switch | Slide the switch to the left (←) | Slide the switch to the right (→)     |
| Selector switch cover       | Remove the cover                 | Remove the cover                      |

If the AC supply is interrupted and the batteries haven't been installed, the instrument goes off and the measured data may be lost.

### Battery Mark on the LCD / Battery Level

| Powered by AC supply  | Powered by Battery   |
|---|--|
| 0 - 100% (Icon by 20%)  | 0% - 100% (Icon by 20%)  |
| 100%: Possible continuous measurement approx 2 hours* with alkaline batteries                     | 100%: Measurement continuous. Data save is ceased. (Measured data is saved.) |
| 0%: Battery is exhausted (accuracy not guaranteed). Instrument operates as follows automatically. | 0%: Measurement continuous. Data save is ceased. (Measured data is saved.)   |

\* reference time when using the instrument with indication on the LCD.

A continuous measurement with alkaline batteries is limited to 1 hour; use of an ac power supply is recommended. Batteries should be considered and used as a back-up.

KEW6310 Charging the rechargeable Ni-MH batteries

### Charging the rechargeable Ni-MH batteries

Following message to prompt battery charge appears on the LCD automatically when battery level is 40% or less at starting the instrument. Press the **ENTER** Key and **ENABLED** Key according to the instructions displayed on the LCD.

- Install rechargeable batteries (Ni-MH)
- Slide the Selector switch to the right (set to "RECHARGEABLE" position)
- Connect the AC Power cord and power on the instrument.
- Refer to "4.2.4.1 Other Settings" in the full instruction manual to initiate a battery charge system if it is necessary.

```

graph TD
    Start([Charge batteries?]) -- No --> NoReturn([Return to normal screen. Batteries aren't charged.])
    Start -- Yes --> Proceed([Proceed to next screen])
    Proceed --> Installed{Rechargeable batteries installed?}
    Installed -- No --> NoReturn
    Installed -- Yes --> ChargeStart([Battery charge starts, return to normal screen.])
  
```

Battery charge doesn't initiate only by installing rechargeable batteries and connecting an AC power cord. Above operation is required to start a battery charge.

### How to install batteries:

Install batteries in correct polarity as marked inside.

Battery power is consumed even if the instrument is being off. Remove all the batteries if the instrument is to be stored and will not be in use for a long period.

KEW6310 Cord Connection

### Cord Connection

Match the arrow marks.

Rated supply voltage : 100 - 240VAC (±1.0%)  
Rated supply frequency : 45 - 65Hz  
Max power consumption : 20Wmax

### Start-up Screen

Model name and software version will be displayed upon powering on the instrument, and self-check routine initiates automatically. The KEW logo will appear. Stop using the instrument if error messages appear on the LCD after the self-check and refer to (Section 15) Troubleshooting in the full instruction manual.

### 4. Setting [SETUP]

The "SET UP" consists of following 4 settings.

- [Basic Setting]: Setting of items common to all measurements
- [Measurement Setting]: Setting of each measurement
- [Save Setting]: Setting of data save methods
- [Other Setting]: Environmental setting

Press the **←** [Left] key to browse through setting items.

Select any desirable items with **Δ** [Up] / **▽** [Down] keys and confirm it with **ENTER** key. Using the **ESC** key cancels the setting change. Following is an example to select the wiring to be tested at basic setting.

1. Select a setting item - Wiring
2. Select a proper wiring configuration
3. Confirm the selected wiring configuration

Move the cursor to "Wiring", and press the **ENTER** key.

Move the cursor to the wiring configuration, and press the **ENTER** key.

Setting completes.

\* Cursor will move onto any of the red parameters.

### Basic Setting

| Setting item                          | Details of Setting  |                                     |                    |                                   |                                    |                                     |                                       |                      |                           |                                |                                |                                   |         |                                |  |                                   |  |                                |  |                                |  |

\* Default values are highlighted in gray.  
Leakage clamp sensor cannot be used for power measurements, but can be used on zero voltage (0.0V) and 0.

### Wiring Configuration

**Orientation of Clamp sensor**

Reverse changing switches the symbols (L/R) for active power.

### Measurement Setting

| Setting item                  | Details of Setting  |   |  |   |   |                 |   |                  |  |   |   |       |  |     |  |     |  |            |  |               |   |             |                            |           |  |                  |   |            |                                    |               |   |       |   |         |   |                            |   |                   |  |        |          |                 |  |            |  |                    |   |                 |  |         |                            |                    |                       |             |                               |                  |                 |                     |                  |

\* Default values are highlighted in gray.

### Measurement Setting

| Setting Item | Details of Setting  |
|--------------|---|
| Interval     | 1sec / 2sec / 5sec / 10sec / 15sec / 20sec / 30sec / 1min / 2min / 5min / 10min / 15min / 20min / 30min / 1hour |

\* Interval can be selected at W, No, DEMAND, WAVE, Harmonic analysis, Swirl / Dip / Int, Transient, Inrush current, Unbalance ratio and Capacitance Range. At WAVE Range and Harmonic analysis, available intervals depend on the number of cascades. At Harmonic analysis, 1 sec test is not available.

### Save Setting

\* Saved data with no number at the space contains the name of the measured values.

**Saving instantaneous values**

1 Press **Start** → **Menu** → **Measure** → **Configuration** to start recording after checking the settings.  
Press the **Start** button at least 2 sec to start recording immediately.

2 Press **Manual** → **Timer** to set recording time.  
File name for saving data is displayed.  
Data saving starts. **Start** appears and flashes. Status indicator LED flashes.  
Standby until preset time comes.  
Preset start time comes.  
Status indicator LED is ON. **Start** flashes and **Stop** or **Clear** is displayed. (Flashes in red according to the preset interval)  
No setting change can be made during data saving.

3 Press **Stop** → **Clear** to preset termination time comes.  
File name for saving data is displayed.  
Status indicator LED goes off.  
**Start** and **Clear** or **Stop** goes off.

**6. Integration value measurement [Wh]**

**Steps for measurement**

Ensuring your safety → **GET UP!** Range → Save Setting

Preparation for measurement → Wiring Interval Recording method  
V Range Save item (Wh) Recording start  
V1 Range -1st value Recording termination  
Clamp Sensor - Avg value Destination to save data  
Setting → A Range - Min value Destination to save screen list  
CT Ratio - Max value  
Wiring → DC V Details  
Frequency

Integration value measurement → [Wh] Range

\* Readings are displayed right after the recording of integration value measurement starts.

Symbol displayed on the LCD

|     |   |     |   |     |   |
|-----|---|-----|---|-----|---|
| WP+ | : Active electric energy (consumption)  | WS+ | : Apparent electric energy (consumption)  | WQ+ | : Reactive electric energy (consumption)  |
| WP- | : Active electric energy (regeneration) | WS- | : Apparent electric energy (regeneration) | WQ- | : Reactive electric energy (regeneration) |

**Switching displays / Viewing W Range**

Select a system → **←** **Cancel** Key → **→** **Next** Key

Select a channel → **Δ** **V** **Measure** Key

Display for W Range  
Display for W Range

\* Press **Next** Key to switch on the display for Wh Range and W Range.

**Save data**

**FILE OPERATIONS**

Preset start time comes.  
Status indicator LED is ON. **Start** flashes and **Stop** or **Clear** is displayed. (Flashes in red according to the preset interval)  
No setting change can be made during data saving.

3 Press **Stop** → **Clear** to preset termination time comes.  
File name for saving data is displayed.  
Status indicator LED goes off.  
**Start** and **Clear** or **Stop** goes off.

**Measurement Screen**

**Remaining time (Time left)**  
Demand interval is counted down.

**Target value**  
Should be set for each measurement.

**Predicted value**  
Predicted demand value when preset demand interval elapses under preset load.  
(Present value) × (preset interval) / (elapsed time)  
\* Integration and calculations are done as time elapses.

**Measured max demand with time & data information**  
Max demand recorded in a measuring period is displayed. (Displayed value will be refreshed if any higher demand is detected.)

**Shifts in specific period**

**Remaining time (Time left)**  
Demand interval is counted down.

**Load factor**  
Percentage of the present value against the target value.  
(present value) / (target value)

**Prediction**  
Percentage of the predicted value against the target value.  
(predicted value) / (target value)

**Target value**  
Arrow mark on the graph (▲) is blue when the value is within the target demand, and becomes red when the target value is exceeded.

**Digital output signal**  
watts when the predicted value exceeds the target value.

**Target value**  
**Predicted value**  
**Target value**  
**Demand value (present value)**

|                                 | 1min                    | 128                       | 128                 |
| Capacitance                     | 1sec                    | 128                       | 128                 |
|                                 | 1min                    | 128                       | 128                 |
| Max number of file              | Measurement data (Text) | 512                       | 512                 |
|                                 | Graphics file (BMP)     | 512                       | 512                 |

\* In case that no file exist in the CF card or the history memory when the history memory is full, the measurement will be stopped.

\*\* Assumed one event occur per minute and calculated.

Activate  
Go to Setting

**Data transfer**  
Data in the CF card or internal memory can be transferred to a PC via USB connection or CF card reader.

| Transfer to PC via:         | Card reader              |                          |
|-----------------------------|--------------------------|--------------------------|
|                             | USB                      | Card reader              |
| CF card data (file)         | <input type="checkbox"/> | <input type="checkbox"/> |
| Internal memory data (file) | <input type="checkbox"/> | <input type="checkbox"/> |

- \*1 It is recommended to transfer the data with file size by a size of CF card reader since transfer of each data via USB takes time. (Transfer time: approx 4MB/ hour)
- \*2 Data in the internal memory can be transferred to a CF card.

\*As to the manipulation of the CF card, please refer to the instruction manual attached to the card.  
\*In order to save the data without any problems, make sure to delete the file other than the data measured with this instrument in the CF card.

**File format and name**

| File Name       | ①   | ②               | ③  | ④  | ⑤  | ⑥  |
|-----------------|-----|-----------------|----|----|----|----|
| Measuring Items | 01  | 02              | 03 | 04 | 05 | 06 |
| Save in         | ME  | Internal memory |    |    |    |    |
| File No         | 001 | 999             |    |    |    |    |
| Format          | CSV |                 |    |    |    |    |

**Configuration file**

| File Name | ①      | ②       | ③ | ④ | ⑤ | ⑥ |
|-----------|--------|---------|---|---|---|---|
| Save in   | CF     | CF card |   |   |   |   |
| File No   | 000000 | 999999  |   |   |   |   |
| Extension | KAS    |         |   |   |   |   |

**Bitmap file**

| File Name | ①   | ②               | ③ | ④ | ⑤ | ⑥ |
|-----------|-----|-----------------|---|---|---|---|
| Save item | PS  | Print screen    |   |   |   |   |
| Save in   | CF  | CF card         |   |   |   |   |
| File No   | ME  | Internal memory |   |   |   |   |
| File No   | 001 | 999             |   |   |   |   |
| Extension | BMP |                 |   |   |   |   |

**Backup Memory**

In case one CF card is removed and inserted while saving data:

**Saving**

- A file is created in the CF card, when CF card is selected as a destination for saving data, and measurement data is saved to the CF card.
- A backup file is created in the internal memory when a CF card is removed at saving data. Further data is saved to the internal memory.
- When inserting the CF card again during a data saving, further data will be saved to the last available space in CF card. (Over ②).

**Saving completes**  
Backup files in the internal memory are automatically transferred to the last available space in a CF card. (File series is as follows.)

**Download completes**  
Use of supplied software (PCW-PWA-MAS/REX) enables to sort files in time-series.

Activate  
Go to Setting

**12. Wiring check**

Proper wiring can be checked at WAVE Range.

| 1. Ordinal screen         | 2. Checking wiring  | 3. Check completes   |
|---------------------------|---|--|
|                           |   |  |
| Press the <b>MEM</b> Key. | Wiring check starts.<br>[Checking status] (Probe record) are displayed. | Wiring check completes.<br>In case of No., Error message appears. (Press the <b>ENTER</b> Key when OK is displayed.) |

\* Check results may be affected if great power factors exist at the measurement sites.

**Criteria of Judgment and cause**

| Check           | Criteria of Judgment   | Cause   |
|-----------------|--|---|
| Frequency       | Frequency of V1 is between 42 and 68Hz.  | <ul style="list-style-type: none"> <li>Voltage clip is firmly connected to the DUT?</li> <li>Measuring too high harmonic components?</li> </ul>   |
| Voltage input   | Voltage input is 10kV or more of Voltage Range x V1.   | <ul style="list-style-type: none"> <li>Voltage clip is firmly connected to the DUT?</li> <li>Voltage test leads are firmly connected to the Voltage input terminals on the instrument?</li> </ul>   |
| Voltage balance | Voltage input is within ±30% of reference voltage (V1) * (not judged by simple phase wiring) | <ul style="list-style-type: none"> <li>Setting against the wiring under test are matched?</li> <li>Voltage clip is firmly connected to the DUT?</li> <li>Voltage test leads are firmly connected to the Voltage input terminals on the instrument?</li> </ul> |
| Voltage phase   | Phase of voltage input is within ±10° of reference value (proper vector).                    | <ul style="list-style-type: none"> <li>Voltage test leads are properly connected? (Connected to correct channel?)</li> </ul>  |
| Current input   | Current input is 5kA or more of Current Range x V1.  | <ul style="list-style-type: none"> <li>Clamp sensors are firmly connected to the Power input terminals on the instrument?</li> <li>Setting for Current Range is appropriate for input level?</li> </ul>   |
| Current phase   | Current input is within ±60° of reference value (proper vector).                             | <ul style="list-style-type: none"> <li>Arrow mark on a Clamp sensor and the orientation of flowing current is matched? (Power supply to Load)</li> <li>Clamp sensors are connected properly?</li> </ul>   |

**TESTING METHODOLOGY OF THE PROJECT OF THE TRANSFORMATION OF  
COMMERCIAL AIR CONDITIONING COMPANIES (HCFC PHASE-OUT  
MANAGEMENT PLAN (HPMP) EGYPT (STAGE II)),  
UNIDO ID: 140400**

**1. Introduction:**

The project aims to provide technical assistance for the implementation of low GWP technology as well as examining the introduction of a Not-In-Kind technology, namely: Indirect Evaporative Cooling (IEC).

The project also proposes to look into the introduction of IEC in commercial air conditioning applications. The goal of the project is to secure phase out of HCFC in the commercial air conditioning manufacturing sector.

In September 2015, the world's nations agreed to adopt a set of 17 Sustainable Development Goals (SDGs). Egypt affirmed its commitment to meet the targets set by SDGs by 2030 and outlined a 15-year development strategy. The SDGs, spearheaded by the United Nations, include resilient, stable, and sustainable infrastructure as one of its goals, thus, the green building landscape is expected to soar in the upcoming years.

**2. General Scope of tests**

To test hybrid IEC Unit simultaneously with the DX Unit to find out the performance of the hybrid IEC unit compared to the DX unit, in particular its total cooling capacity and the energy efficiency ratio EER at various ambient operating conditions. The tabulation, evaluation and plotting of the results will be included in the program final report and will include an economic evaluation of the IEC hybrid system to help establish its commercial feasibility in the local market.

### **3. EUROVENT role, Egypt Climatic Zones and Field Testing**

#### **EUROVENT:**

The application of any new technology, in larger capacities of commercial air-conditioning applications, requires setting the ground to allow market acceptability noting that these are not off-the-shelf products that industry can put in markets in substantial quantities. Commercial air-conditioning applications are commonly specified by consultants for projects to ensure reliability of the product that can justify the initial investment.

The project invited EUROVENT, the internationally renowned organization with experience in guidelines and certification programs for HVAC applications including IEC systems, to provide a reference testing methodology for the IEC hybrid units suitable for Egypt's working conditions. EUROVENT provided testing procedures (see EUROVENT XX/1- 2022 Hybrid Indirect Evaporative Cooling Equipment: Requirement and Test Method), will review and endorse the results of the project.

Egypt has 8 climatic zones out of which 7 are suitable for IEC applications due to lower humidity conditions across the summer season. Below figure shows:

**Egypt climatic zones:**

|   |                                     |   |                       |
|---|-------------------------------------|---|-----------------------|
| 1 | North Coast Region                  | 5 | Eastern Coast Region  |
| 2 | Delta Cairo and middle Sinai Region | 6 | High Heights Region   |
| 3 | North Upper Egypt Region            | 7 | Desert Region         |
| 4 | Southern Upper Egypt Region         | 8 | South of Egypt Region |

**Field Testing:**

Field Testing will be done in the open air throughout a whole day, for both the IEC hybrid unit and the DX unit.

#### **4. Testing Plan**

Testing plans were developed after intensive rounds of discussion and consultation with local OEMs and formal communication. Technical visits were made to manufacturing facilities to better understand capacities and readiness to build prototypes.

It was decided to start the tests in Climatic Zone 2 (Delta, Cairo Region and middle Sinai) at an altitude of 344.5 feet above sea level.

The first testing batch will start on the 15<sup>th</sup> of June 2022 in Climate Zone 2 (Delta Cairo and middle Sinai Region) followed by a second testing batch starting in the second half of July 2022 at Climatic Zone 5 or 8.

#### **5. General Testing Conditions**

The testing will be conducted for all OEMs that indicated the readiness of their units by the time the start date indicated for in Climatic Zone 2 (Delta, Sinai central and Cairo Region).

- a. There are no intentions to compare the performance of OEMs units, one against the other. This is why OEMs are labelled by a confidential number and not by their original name.
- b. The purpose of the tests is to make sure there are energy efficiency advantages obtained by adopting a hybrid IEC system when compared to a DX or Chilled Water system for the Egyptian Climate Zones 2 and 5 or 8.
- c. The schematic diagram below shows the position of the units during testing. Both DX and hybrid units are to be located at the same site, with a distance in between to guard against short cycling.
- d. Both units to be full fresh air with air discharge of one unit regulated so that it matches the other.
- e. The primary air outlet dry bulb temperature will try to maintain 15 °C.
- f. For each OEM, testing will be performed over a 24hr period for both units simultaneously.
- g. The tests will be performed for all OEMs, one after the other.
- h. The tests will be considered completed once a 24 hrs cycle is recorded for both IEC hybrid and DX units.

- i. The tests meteorological readings will be recorded.
- j. The tests are be performed to obtain the total cooling capacities and the energy efficiency ratios of both IEC hybrid and the DX unit for each OEM simultaneously and compare the results over a 24 hours period.
- k. In the final report, the test values will be plotted and analysed to help in obtaining a definite understanding of the advantages of the systems at various Climatic Zones.
- l. An economic comparison will be made comparing the Net Present Value (NPV) of the IEC hybrid compared to a DX unit over its lifetime to check its economic feasibility.

Schematic diagram of testing unit's emplacement at the test site.

## **6. Testing Methodology**

### **6.1 EUROVENT**

The testing methodology is based on:

“Eurovent XX/1 — 2022 Hybrid Indirect Evaporative Cooling Equipment: Requirements and Test Method”

Recorded Individual data for each OEM

- Date of test
- Test identification number
- Latitude of the location where the test is done
- Longitude of the location where the test is done
- Altitude of the location where the test is done
- Indication of the Egypt climate zone
- Serial number
- Model dimensions

### **6.2 Calculation of total cooling capacity ( $q_{tot}$ )**

The Total Cooling Capacity (kW) of the Indirect Evaporative Cooling Units is calculated as follows:

$$q_{tot} = 1.21 Q_p (h_1 - h_2)$$

Where:

$q_{tot}$  = Total Cooling Capacity, kW

$h_1$  = Primary air inlet enthalpy (from psychrometric chart and calculation), [kJ/kg]

$h_2$  = Primary air outlet enthalpy (from psychrometric chart and calculation), [kJ/kg]

$Q_p$  = Primary air flow rate, [kg/s]

### 6.3 Calculation of Energy Efficiency ratio (EER)

The Energy Efficiency Ratios the ratio of the total cooling capacity to the power input:

$$EER = \frac{q_{tot}}{W}$$

Where:

EER = Energy Efficiency Ratio, B.t.u/hr. W and in W/W

$q_{tot}$  = Total cooling capacity, kW

$W$  = Total Power input [kW] =  $W_p + W_s + W_c + W_{DX}$

$W_p$  = Power of the fans for primary air

$W_s$  = Power of the fans for secondary air

$W_c$  = Power of the recirculating pump

$W_{DX}$  = Power of the direct expansion coils/system

### 6.4 Measurements:

The tests will record the following values, on the hour, every hour for a 24 hours period:

- the Primary air inlet dry bulb temperature
- the Primary air outlet dry bulb temperature
- the Secondary air inlet wet bulb
- the Secondary air inlet dry bulb
- the Primary air flow rate
- the Total Power input
- the EER
- the total cooling Capacity
- the power of fans for primary air

- the power of fans for secondary air
- the power of the recirculating pump
- the power of direct expansion coils/system
- the water consumption

### ***7. The Final Report***

The final report will include the following:

- Individual data for each OEM.
  - Hourly readings of the IEC hybrid unit
  - Hourly readings of the DX unit
  - Calculation of total cooling capacity
  - Calculation of Energy Efficiency ratio
  - Graph showing the total cooling capacity of the IEC hybrid and the DX unit versus the hours for 24 hours cycle, and including the ambient dry bulb and ambient relative humidity
  - Graph showing the total energy efficiency ratio of the IEC hybrid and the DX unit versus the hours for 24 hours cycle, and including the ambient dry bulb and ambient relative humidity
  - Cooling Effectiveness of the IEC hybrid unit versus the hours for 24 hours cycle
  - Discussion of the results
  - Economic Net Present value comparison of the IEC hybrid versus the DX system to help establish its commercial feasibility to local market.

## **8. Standards used in the tests**

- ANSI/ASHRAE Standard 133-2015 - Method of Testing Direct Evaporative Coolers, American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta.
- EN 14511-3: 2013. – Air-conditioner, Liquid Chiller packages & Heat Pumps with electrically driven compressor for space heating & cooling – Part 3 - Tolerance for reading temperature measurement.
- ANSI/ASHRAE Standard 143-2015 - Method of Test for Rating Indirect Evaporative Coolers, American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta.
- ASHRAE Standard 41.2-2018 - Standard Methods for Air Velocity and Airflow Measurement
- ISO 5801-2017 - Fans Performance testing using standardised airways
- ECP-24 EC:2021 - Technical certification rules of the Eurovent Certified Performance Mark-Evaporative Cooling-

## Annex (4) Results in CZ2

Results and Calculations for OEM2 - CZ2

IEC Hybrid Unit , Air flow = 2000 cfm (3398 m3/hr), Altitude = 208 m , , water bath area = (1000\*900) mm2, size of duct for air balancing = 0.3 m \* 0.7 m

## **Annex (6) Accuracy and Sensitivity of Measurements:**

In order to ensure reliable results, all measurements were carried out using instruments that have been calibrated at internationally accredited laboratories. The accuracy of the measurements was scrutinized to determine the degree of how close a calculated or measured value is to the actual value. One factor that can determine the accuracy of results is the measurement tool used, as it can only record as many digits as it allows.

Accuracy of measurements is guaranteed by following the posterior steps:

- 1- Collecting data: records for all measurements were electronically saved using the equipment's software programs to tools such as spreadsheets.
- 2- Values were sorted to help determining the range of data collected.
- 3- The average value of the data, gives a measurement of accuracy.
- 4- Each individual measurement was subtracted from the average value to give a set of absolute deviations. The absolute deviation of each measurement show how close the value is to the average value.
- 5- Precision was measured as the average value plus or minus the average deviation.
- 6- The uncertainty is calculated by defining the sources of uncertainty in the measurement.
- 7- The uncertainty from each source is estimated then combined to give an overall estimation.
- 8- There are two approaches to estimate Uncertainty:
  - a. Type A evaluations: uncertainty estimated using statistics (repeated readings)
  - b. Type B evaluations: uncertainty estimated from any other information (resolution, annual drift in errors, manufacture's specifications, and environmental conditions).

The following Table shows the names, model numbers, serial numbers, scale ranges, accuracy and expanded uncertainty of each instrument used during the tests performed.

| Used Apparatus    | Code of Used Apparatus | Measured Property                               | Model          | Serial Number | Scale Range                   | Accuracy           | Expanded Uncertainty | Item Photo   |

**Annex (7) The presentation of the outreach campaign:**

Dear Invitee,

UNIDO, UN environment and HBRC are pleased to invite you to attend a workshop on output of:

**"Project of The Transformation of Commercial Air Conditioning Companies"**

**HCFC Phase-out Management Plan (HPMP II- EGYPT)**

**Date: Wednesday 21<sup>st</sup> December 2022.**

The meeting will be held at HBRC, Address: 87 El-Tahrir ST. Dokki - Giza.

Kindly note that the meeting starts at 10:30 a.m. and is planned to end at 2:00 p.m. (Cairo time).

**Prof. Sayed Shebl**

A blue ink signature of Prof. Sayed Shebl, consisting of a stylized, cursive script.

**Team Leader, Director of  
Electro – Mechanical Institute, HBRC**

**Prof. Alaa Olama**

A black ink signature of Prof. Alaa Olama, featuring a stylized, cursive script.

**Project Manager and Technical Consultant**

## Project of the Transformation of Commercial Air Conditioning Companies (HCFC Phase-out Management Plan (HPMP) EGYPT (Stage UNIDO project: No.140400)

---

HBRC – Wednesday 21 December 2022, 10:30 AM– 14:00 PM

### Abstract

The project aims at providing technical assistance for the implementation of low GWP technology as well as examining the introduction of a Not-In-Kind technology, namely: Indirect Evaporative Cooling (IEC). The project also proposes to look into the introduction of IEC in commercial air conditioning applications. The goal of the project is to secure phase out of HCFC in the commercial air conditioning manufacturing sector.

### Program

- 10:30 – 11:00 am      **Registration**
- 11:00 – 11:45 am      **First Lecture**  
  
   **-Testing Methodology and Instrumentation**  
**Prof. Sayed Shebl**  
Director of Electro- Mechanical Institute HBRC
- 11:45 – 12:15 pm      **Coffee Break**
- 12:15 – 13:00 pm      **Second Lecture**  
  
   **- Discussion OF Findings and Conclusion**  
**Prof. Alaa Olama**  
International Expert and UN RTOC member
- 13:00 – 14:00 pm      **Open Discussion**

**Transformation of Commercial Air Conditioning Companies  
Project (HCFC Phase- out Management Plan (HPMP) EGYPT  
( Stage II)), UNIDO ID:140400**

**Workshop**

**SPEAKERS**

**Prof.Sayed Shebl**

Director of Electro- Mechanical Institute HBRC

**Prof. Alaa Olma**

International Expert and UN RTOC member

**21 Wednesday 2022**  **11:00 AM - 14:00 PM**

**LIVE**

Zoom Meeting ID: 8360149880

Passcode: hbrc2021

**HBRC**

87 El-Tahreer ST. Dokki - Giza

## Annex(7): The presentation of the outreach campaign:

Transformation of Commercial Air Conditioning Companies

HCFC Phase-out Management Plan (HPMP) EGYPT (Stage II), UNIDO ID:140400

# Direct Indirect Evaporative Cooling in Egypt

**Presented by:**

**Prof. Alaa Olama;**

**The Project general Manager and Technical Consultant**

**Prof. Sayed Shebl;**

**Director of Electro-Mechanical Research Institute EMI, HBRC, Egypt**

# Phase-out & Phase-down Strategies

Presented by:

**Eng. Ayman Eltalouny;**

International Partnerships Coordinator  
OzonAction, Law Division  
UN Environment Programme (UNEP)

# Why Refrigeration and Air-Conditioning Sector is of high importance

## Economics

- One of the fastest Growing sectors globally
- Protecting Capital Expenditures (CAPEX) & Minimizing Operating Expenditures (OPEX)
- Competent workforce and employment opportunities

## Environment

- Environmental Footprint
- Emissions Reduction
- Climate Action
- Energy Efficiency
- Refrigerant Management

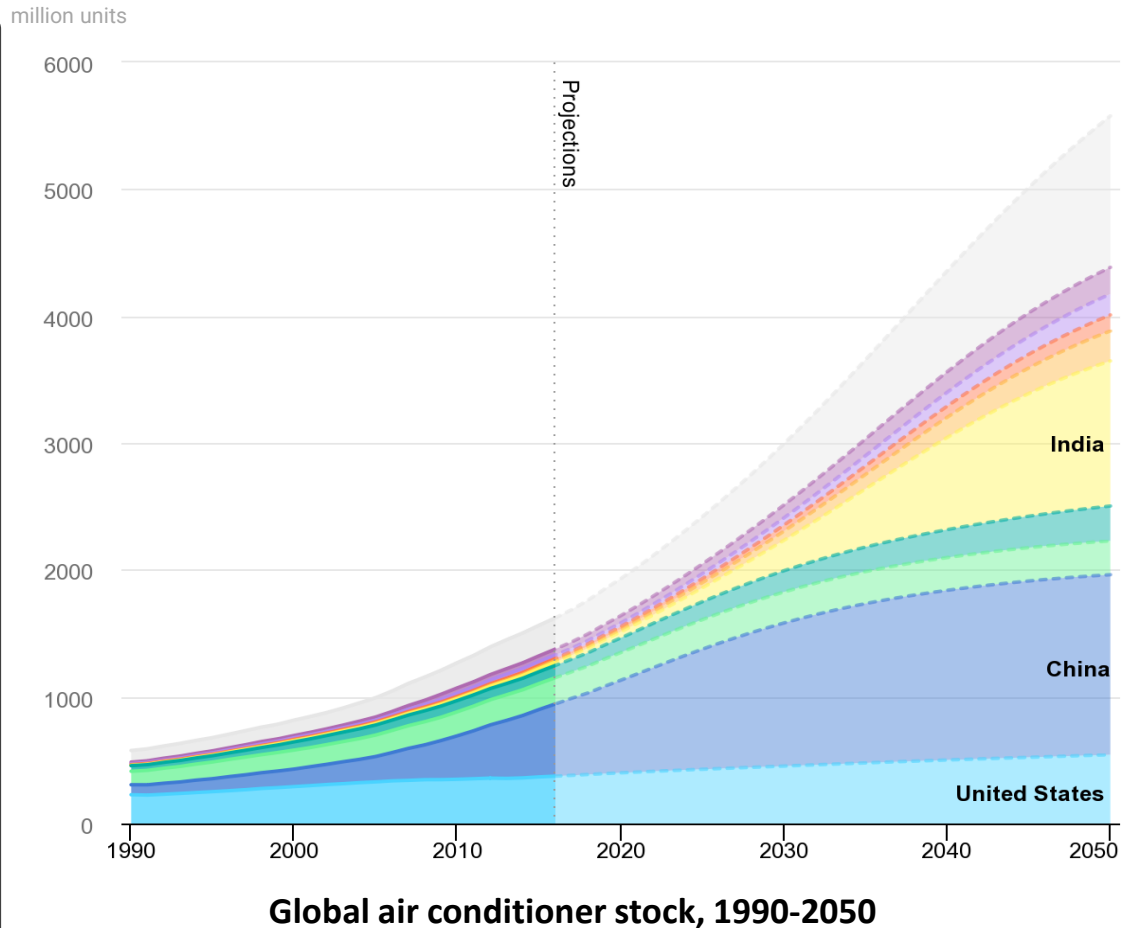

## Sustainability

- Contribution to Food Security and Food Safety
- Sustainable Urban Planning & Cities
- Renewables
- Innovation and Smart Operations
- Sustainable Consumption of Materials

# Population Growth & Energy Bill

- Cooling is the fastest growing use of energy in buildings
- Cooling will drive peak electricity demand, especially in hot countries
- Most homes in hot countries have not yet purchased their first AC
- Investing in more efficient ACs could cut future energy demand in half

# Montreal Protocol – A tool to protect ozone & climate

## Handbook for the Montreal Protocol on Substances that Deplete the Ozone Layer

Twelfth edition (2018)

### HFC control measures as per the 2016 Kigali Amendment

Non-Article 5 parties

Baseline formula

Average HFC consumption for  
2011-2013 + 15% of HCFC  
baseline\*

A5 parties – “Group 1”

Baseline formula

Average HFC consumption for  
2020-2022 + 65% of hydrochlo-  
rofluorocarbon (HCFC) baseline

A5 parties – “Group 2”

Baseline formula

Average HFC consumption for  
2024-2026 + 65% of HCFC  
baseline

# Refrigerant (re)evolution – transition to low-GWP

- **1830s-1930s – whatever worked:** primarily familiar solvents and other volatile fluids including ethers, ammonia (NH<sub>3</sub>), carbon dioxide (R-744), sulphur dioxide (R-764) and others
- **1931-1990s – safety and durability:** primarily chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), ammonia, and water (mostly used in absorption cycles).
- **1990s – 2010s – avoidance of Ozone Depleting Substances,** following attention to stratospheric ozone protection arising from the Montreal Protocol.
- **2010s onwards** – intention to adopt refrigerants with **as low a GWP as practicable** due to the focus on climate change.

| 100 Year GWP | Classification          |
|--------------|-------------------------|
| < 30         | Ultra-low or Negligible |
| < 100        | Very low                |
| < 300        | Low                     |
| 300-1000     | Medium                  |
| > 1000       | High                    |
| > 3000       | Very high               |
| > 10000      | Ultra-high              |

# Refrigerant Selection Criteria

**Climate impact**

**Other environmental impacts, including ODP**

**Energy efficiency**

**Thermal energy storage**

**Refrigerant cost**

**Commercial availability**

**Technological level**

**High ambient temperature fitness**

**Safety risk**

**Flammability & decomposition after refrigerant releases**

**Liability, responsibility**

# Testing Strategies and Setup

Presented by:

Prof. Sayed Shebl;  
The Project Team Manager

# Direct Indirect Evaporative Cooling (IEC) in Egypt

|                   |              |                 |               |
|-------------------|--------------|-----------------|---------------|
| <b>Start date</b> | May 25, 2021 | <b>End date</b> | Dec. 31, 2022 |
|-------------------|--------------|-----------------|---------------|

## NIK Technology

## Scope

- Phase out of HCFC in the commercial air conditioning manufacturing sector.
- Transformation of Commercial Air Conditioning Companies.

## Purpose

- Introduction of a not-in-kind cooling technologies.
- Adoption of low-GWP technologies

## Milestones

- ◆ 1 | Technical Assistance for product design
- ◆ 2 | Incorporate IEC technology in existing systems
- ◆ 3 | Field testing and commercial feasibility

# Direct Indirect Evaporative Cooling (IEC) in Egypt

| OEMs   |  | Approval committee |  |
|--|--|--------------------|--|
| Delta Construction & Manufacturing (DCM)     | TIBA Engineering Industries Co.                        | UNIDO & NOU        | Steering Committee   |
| MISR Engineering Industries                  | VOLTA EGYPT  | UNEP               | Advisor  |
| Egyptian German Air Treatment Company (EGAT) | Misr Refrigeration & Air Conditioning MFG Co. (MIRACO) | EUROVENT           | Provide a reference testing methodology for the IEC hybrid units suitable for Egypt's working conditions |

## Process

### Vision & Objectives

- New Refrigerant
- New Cooling Technology
- Energy Efficiency

### Performance Gap

- Guiding Principles for prototypes design

### Testing Methodology

- Target parameters

### Evaluate Process

- DX Unit versus IEC-H Unit, Same operating conditions

### Assess Results

- EER;
- Cooling Capacity;
- Feasibility Study

## Which Climatic Zone?

Two climatic zones out of Eight representing Egypt

## Field Testing Logistics

Testing Locations, and Used Apparatuses

## Analyzing Data

Provide technical parameters obtained from field testing

of IEC code

Findings & Future Work

# Feasibility Study & Financial Analysis

Presented by:

**Dr. Hossam Heiba**

Manager Director of the General  
Authority for Investment and Free Zones

# Feasibility Study

|   |               |
|---|---------------|
| Max. Power Consumption IEC Hybrid Unit (W/hr)             | 8,607         |
| Max. Power Consumption DX Unit (W/hr)                     | 10,802        |
| Annual Electricity Consumption IEC Hybrid Unit            | 37,698,660    |
| Annual Electricity Consumption DX Unit                    | 47,314,512    |
| Average Cost (kW/hr)                                      | 1.60 (EGP)    |
| Electricity cost for IEC Hybrid Unit (EGP)                | 60,318        |
| Electricity cost for DX Unit (EGP)                        | 75,703        |
| Maximum Water Consumption for IEC Hybrid Unit (Liters/hr) | 54            |
| Annual Water consumption for IEC Hybrid Unit (Liters/hr)  | 236,520       |
| Water Cost per Cubic meter                                | 5.00 (EGP)    |
| Water Cost for IEC Hybrid Unit (EGP)                      | 1,183         |
| Electricity Saving  | 15,385        |
| Water Expenditure   | (1,183)       |
| <b>Net Saving</b>   | <b>14,203</b> |

# Results & Technical Analysis

Presented by:

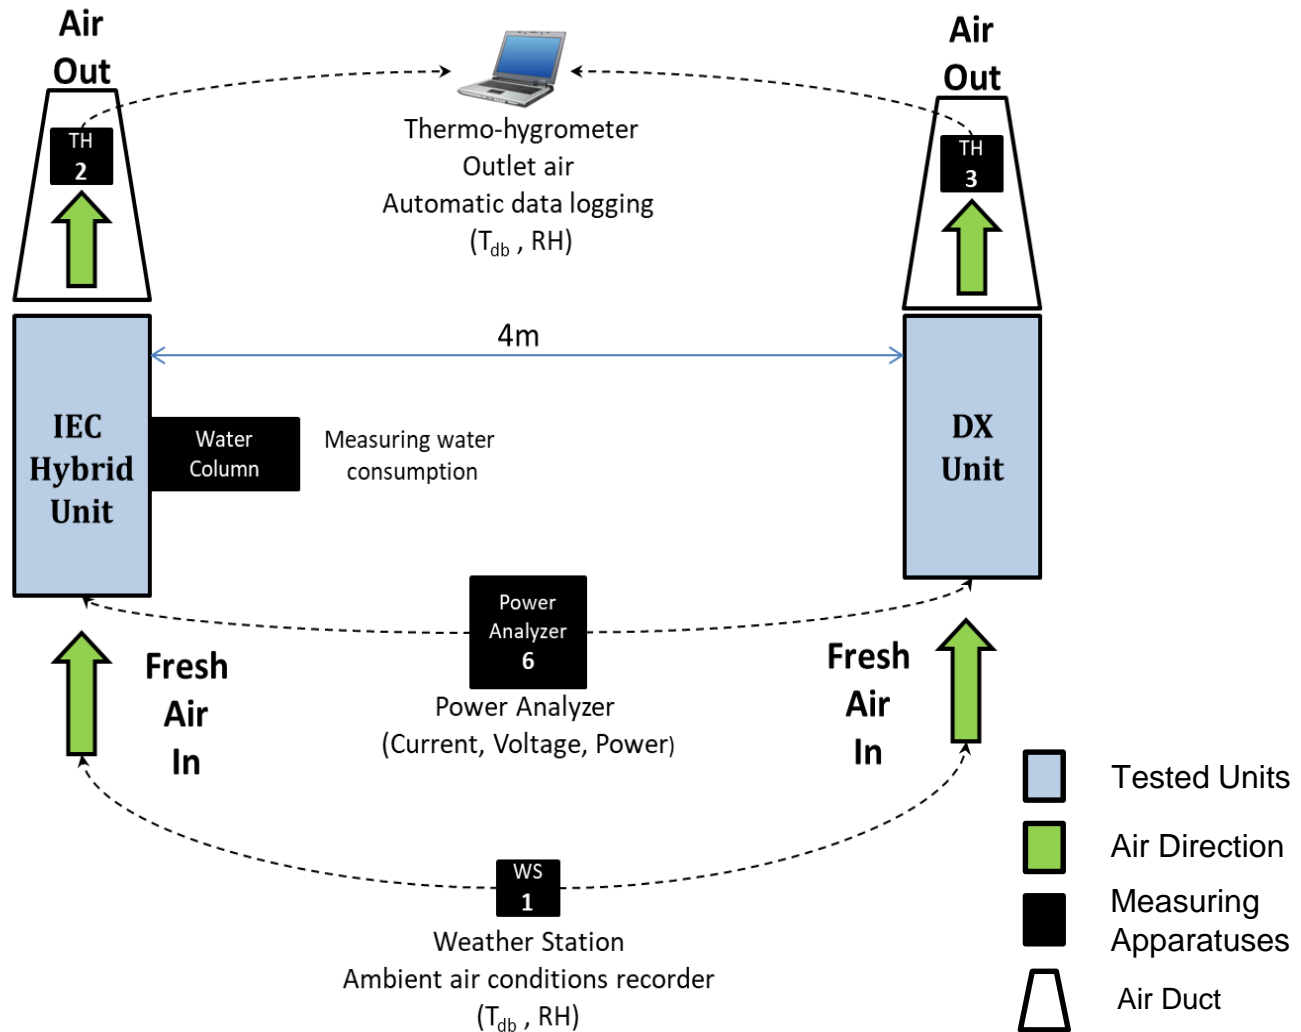

**Prof. Alaa Olama;**

The Project general Manager and  
Technical Consultant

# Schematic Diagram

The project required each OEMs to individually manufacture a custom-built Indirect Evaporative Cooling Hybrid Air Conditioner (IEC-H) prototypes and a central DX unit to test and compare their performances under actual operating conditions in **two of the eight climatic zones of Egypt (CZ2 & CZ5)**.

# General Testing Conditions

## Full Fresh Air

Both units to be **full fresh air** with air discharge of one unit regulated so that it matches the other.

## Compressor Size

Compressor size of IEC-H Unit left to each OEM to decide.

## Primary Air Outlet

The primary air outlet dry bulb temperature maintained at 15°C

## Confidentiality

No intentions to compare the performance of OEMs units. OEMs were labelled by a **confidential number**

## Program Components

## Associated Activities

## Collaborative Progress

1<sup>st</sup> Stage

Cooling Tower

2<sup>nd</sup> Stage

Serpentine and air being cooled through it

3<sup>rd</sup> Stage

Evaporation of water in the stream

# Psychrometric Process

## Project title

Transformation of  
Commercial Air  
Conditioning Companies

## Goal

Build awareness of the  
HCFC Phase-out  
Management Plan (HPMP)

**EER**

## Future

alternative refrigerants  
code and direct/indirect  
evaporative cooling code.

**Cooling Capacity**

**Water Consumption**

**Thermal Comfort**

**Feasibility Study**

# Results Sample – Inlet Versus Outlet Temperature

Inlet Ambient Temperature Versus Outlet Temperature of IEC Hybrid and DX units for OEM2 at CZ5

# Results Sample – EER

EER for IEC Hybrid Unit Versus DX unit for OEM2 at CZ5

# Results Sample – Cooling Capacity

Cooling Capacity for IEC Hybrid Unit & DX Unit Versus Ambient Conditions for OEM2 at CZ5

# Results Sample – Wetbulb

Cooling Capacity versus Outlet Wet Bulb Temperature for IEC Hybrid Unit & DX Unit for OEM2 at CZ5

# Results Sample – Power Components

Power Consumption of DX Unit and IEC Hybrid Unit Components for OEM2 at CZ5

# IEC-H Unit Compressor capacity compared to DX Unit compressor capacity

OEM6

OEM3

OEM2

OEM4

- IEC Compressor smaller by 60% → Lower cooling capacity
- IEC Compressor smaller by 70% → Lower cooling capacity
- IEC Compressor equal to DX Compressor → Equal cooling capacity
- IEC compressor larger by 20% → Equal cooling Capacity

## Observations

No direct relationship indicating whether the capacity of the compressor of the IECH units had an impact on the capacity of the units and whether there was a critical capacity size defining this relationship

Important point that needs further investigation!

# EER in CZ2

# Cooling Capacity in CZ2

# EER in CZ5

# Cooling Capacity in CZ5

# Conclusion

EER

Financial  
Analysis

Different  
Climatic  
Zones

Technical  
Analysis

All OEMs show EERs of the IEC-H units that are superior to corresponding DX units.

IEC-H system is economically advantageous compared to a DX system

Further tests are needed at the highest ambient dry bulb temperatures and the lowest humidity, climatic zone 8.

Superior EERs of the IEC-H units despite the smaller capacity compressors used. The capacities of the IEC-H units were not always larger than these of the DX units.

# Future Work

Use **lower GWP refrigerants** approved in Egypt (Promotion of Low-GWP Refrigerants for the Air Conditioning Industry in Egypt, UNEP/UNIDO 2021) refrigerants R-32 and R-454 B.

The **capacity of the compressor** of the IEC-H units had an impact on the capacity of the unit. There was a critical capacity size defining this relationship associated with the climatic zone where it is located.

Further tests are needed at the highest ambient dry bulb temperatures and the lowest humidity, **climatic zone 8**

**Thank you**
